The Prophets of the Thinking Machines:

Artificial General Intelligene and Transhumanism
History, Theory and Pioneers
Past, Present and Future

The Sacred Computer: *Thinking Machines, Creativity and Human Development*

You can join or help *The Sacred Computer*!

#lotsofpapers #lazar

Lots of Papers: In AI, ML, CV, ANN, DL, ... throughout history, classical 1950s, 1960s, 1970s, 1980s, 1990s, 2000s, early 2010s to 2020s. Computer Vision, Reinforcement Learning, Program Synthesis. Lifelong Learning, Human-Computer Interaction, Mixed Initiative Interfaces; Evolutionary programming, Genetic Algorithms, Self-improving agents; Speech Synthesis, Speech Recognition, Audio Generation etc. Groundbreaking or important researchers or related to the flow and context of the reviewed topics; and a few Bulgarian researchers who participated in some of the works.

* Lifelong Learning, Continual Learning, Reinforcement Learning (historical Q-Learning, modern Deep Q-Learning: Atari DeepMind ...), RL for LLMs, policy optimizations (DPO, PPO, OREO) ... Conditional Random Fields (CRF); Chain-of-Thought prompting ...
* Survery of other techniques and research in computer vision, preceding the explosion of the application of convolutional neural networks after 2012: DBN, RBM, MRF, SIFT etc.
* Survey on Early Deep Learning architectures and Normalizations; seminal papers and PhD theses by pioneers in DL from the schools of LeCun, Hinton, Bengio: M.Ranzato, V.Mnih, A.Krizhevsky, I.Sutskever, A.Mohamed ...
* Survey of Object Recognition and Classification before Deep Learning
* Selected Computer Vision works from 1960s to 2020s
* Exploration and introduction of concepts and techniques in computer vision, machine learning, neural networks
* Mixed-Initiatve Interaction
* Audio: Speech Synthesis, Audio Generation, Speech Recognition; 1980s to 2010s
* Neural Machine Translation, Language Models, LLMs, Text Generation, Text and Language Learning and Representation, Word-Embedding
* Alternative approaches for sequence and next words prediction, instead of neural networks: stochastic memorizer, sequence memorizer* Transformers - the seminal paper from 2017
* Tansformer architectures for images and for reducing the quadratic complexity
* Neural Program Synthesis

* Tansformer architectures for images and for reducing the quadratic complexity
* Evolutionary Algorithms | Genetic Algorithms | Genetic Programming
* Genetic Programming, Genetic Algorithms, Evolutionary Programming: Part II
* Summary and selection of important concepts in Evolutionary Algorithms | Genetic Algorithms | Genetic Programming etc
* Vision Transformers – ViT
* Multimodal Learning, Dialog Learning, Continual Learning
* Diffusion Models
* Self-Improving General Intelligence, Recursive Self Improvement

In order to quickly go to a target: **Search** “Topics: Genetic Programming” etc.

Introductory Notes

* Most of the text in this volume of references is in English, with a few small sections and notes in Bulgarian.
* It is **a record of explorations** and can serve as a dataset for study, recall and food for thought for curious readers and thinking machines.
* The order and clustering is both thematical and chronological through the literature review study.
* Search for specific topics, names, fields etc. as with the other volumes.
* Why diferent fonts? Diversity. Future versions may be generated from a database core or displayed with Vsy/AI agents and generate different layouts, connections etc.
* In the future it would be operated with the AGI infrastructure Vsy (Вседържец, Вси) and the Research Accelerator ACS (unpublished yet), which will make it "living", dynamic, self-extending, translating etc.

* For more Bulgarian and other selected research see also **#Anelia #prophets #Listove** etc.
* Основно на английски, някои бележки на български. Виж: Лазар Вълков, Боян Александров.
* Изследвания на други методи в компютърното зрение от 1960-те до 2000-те и в навечерието на бума на приложенията на конволюционни невронни мрежи в края на 2012 г.; методи в машинното обучение: DBN, RBM, MRF, SIFT; MSER и др. (…)

Томове и приложения на *Пророците на мислещите машини*

Съществуващи и някои възможни бъдещи томове

*** #prophets –** Основен том (>1859 стр., 13.8.2025); Обзор на Теория на Разума и Вселената, сравнение с работи в други школи, които преоткриват и повтарят, или пък предхождат обобщаването на принципите за създаване на общ изкуствен интелект, които бяха формулирани още в началото на 2000-те г. и постепенно се сбъднаха и се сбъдват. Документален преглед на огромен обем научни школи, литература и факти, кратка и подробна хронология … #tosh1

*** #purvata –** ***„****Първата модерна стратегия за развитие чрез ИИ е публикувана от 18-годишен българин през 2003 г. и повторена и изпълнена от целия свят 15-20 години по-късно: Българските пророчества: Как бих инвестирал един милион с най-голяма полза за развитието на страната?“* #tosh2 (31.5.2025, 248 стр.)

*** #listove –** Многообразие от теми сред които класическа и съвременна роботика и планиране, мулти-агентни системи – класически и съвременни с големи езикови модели; невронауки и невроморфни системи, съзнание и панпсихизъм, алгоритмична сложност, други теории на всичко и вселената сметач; когнитивна лингвистика и мислене по аналогия, езикови модели и машинно обучение – исторически и най-нови системи, мултимодални модели, основни модели за агенти и роботи; обзор на научни статии, новини, платформи на чатботове и други пораждащи модели за различни модалности и практика; съветска школа в изкуствения интелект и мн.др. (…), 414 стр. (13.8.2025 г.)

*** #mortal – Нужни ли са смъртни изчислителни системи за създаване на универсални мислещи машини?,** „Смъртните“ системи са свързани с носителя си, за разлика от „безсмъртни“, за каквито се смятат „обикновените“ компютри. Но дали и невроморфните са наистина невроморфни, и какво точно е „безсмъртност“, „смъртност“, „самосъздаване“ (автопоеза) и дали въобще е възможна. Наистина ли са по-ефективни невроморфните системи, както и живите или по-модерните електронни технологии с по-малки транзистори, или ефективността е избор

на „счетоводство“ и скриване на реалните разходи за създаването и съществуването на съответната технология? (…) 70 стр.

*** #universe6 #UnM6 –** Вселена и Разум 6, Т.Арнаудов– #tosh3; съзанание, „метафизика“, „умоплащение“ … на английски; свързана с теми от #mortal (…)

*** Universe and Mind 6** – Connected to “Is Mortal Computation…” – in English. Why infinity doesn’t exist and Goedel theorems are irrelevant for thinking machines? What is Truth, Real and Realness and Why? The fundamentality of mapping (…)

*** #sf #cyber –** Научна фантастика за ИИ, Футурология, Кибернетика … Подробен преглед и сравнение на статия на Майкъл Левин от 2024 г. за самоимпровизиращата се памет с идеи от Теория на Разума и Вселената.

*** #irina –** Беседи и подробни бележки и др. статии; Ирина Риш; вижданията на Йоша Бах и др. и съвпаденията на идеите му с Теория на Разума и Вселената, публикувана 20 години преди коментираните дискусии; интервю с Питър Вос на ръба преди „ерата“ на ентусиазма към Общия ИИ през 2013 г.; сбъднали се предвиждания от 2005 г. за машинния превод и творчеството и за автоматичното програмиране от 2018 г. и др.; беседа с участието на Майкъл Левин (повече от него в #Основния том, #Кибернетика и #Листове.

→ * #lazar #lotsofpapers – this volume; този том ←

*** #anelia –** Обзор на работата на множество български изследователи. Survey of the work of a lot of Bulgarian researchers. See also the main volume and Listove.

*** #instituti**– преглед на институти по ИИ в Източна Европа и света, сравнение на повтарящите се послания; към 2003 г. в България имаше публикувани **2 национални стратегии** за развитие с ИИ - 16 години преди първата чернова на БАН и 19 години преди откриването на INSAIT, и двете дело на юноши.

*** #complexity** – Алгоритмична сложност – обзор и бележки по множество статии и обобщения и изводи. Дали машината на Тюринг е подходяща за описание на *Мислеща машина?* #hector

*** #calculusofart** – Математически анализ на изкуството. Музика I – Как се определя дали даден „къс“ изкуство е красиво и защо ни харесва? Красотата, компресирането и предвиждането на бъдещите данни въз основа на миналите. Музиката трябва да е красива и да се измерва във всички мащаби, от най-малките с постепенно нарастващ обхват.

*** #kotkata –** Задачата от *„Анализ на смисъла на изречение въз основа на базата знания на действаща мислеща машина (...)“,* Т.Арнаудов 2004 г. в диалог с чатботовете ChatGPT и Bard, края на 2023 г. до нач. на 2024 г. и с GPT5 пред 2025 г., който успява да разбере и приложи в опростен вид метода от статията

* **#zabluda –** Заблуждаващите понятия и разбор на истинския им смисъл: трансхуманизъм, цивилизация, ... – книга, която публикувах през 2020 г. и започна като статия за трансхуманизма. Откъсът може да бъде включен и в отделно приложение.

#razvitie #transhumanism – том фокусиран върху развитието на човека, космизъм, „трансхуманизъм“; етика, биотехнологии, мозъчно-компютърен / мозъчно-машинен взаимлик (Brain-Computer Interface, Brain-Machine Interface), невроморфни системи, генетично инженерство, геномика, биология, симулиране на клетки и живи организми и др.

Практика, работилници и др. (бъдещи)

*** #robots-drones-ros-slam-simulation-rl** – Наземни и летящи роботи: дронове; обща теория, практика, конкретни системи и приложения; Robot Operating System (ROS, ROS2); среди за симулации на физически и виртуални роботи и машинно обучение: Gazebo, MuJoCo, RoboTHOR, Isaac Sim, Omniverse; gymnasium и др.

*** #neuromorphic-snn-practice** – Практика по невроморфни системи, импулсни невронни мрежи; Lava-nc и др.

*** #llm-generative-agents** – големи езикови модели: локална работа, платформи; употреба, подготвяне на набори от данни; обучение, тестване. Текст, образ, видео, триизмерни модели, програмен код, цели игри и светове с физика („world modeling“), всякакви модалности; дифузни модели, преобразители (трансформатори), съгласувани с физиката математически модели, причинностни модели с управляващо-причиняващи устройства по идеите от Теория на Разума и Вселената. Агенти, мулти-агентни системи: архитектури и др …
(виж ***Листове*** и ***Лазар****)*

*** #codegen –** автоматично програмиране, синтез на програми; модели за тази цел, платформи; методи, приложения … program synthesis, automatic programming, code generation

*** #sigi-evolve –** саморазвиващи се машини, еволюционни техники, рекурсивно самоусъвършенстване (Recursive Self-Improvement, RSI)

*** #appx** – **Приложение на приложенията**, списък с добавени по-късно; ръководство за четене и др.

* **#agi-chronicles** – хронологичен запис и проследяване на развитие на история, новини, събития, идеи, системи, приложения; изследователи *(вероятно с Вседържец)*

… следват продължения – други приложения и *Вселената*:

*** Създаване на мислещи машини** – … Зрим, Вседържец , Вършерод, Казбород, Всеборавител, Всетводейство, Всевод, …

Внимание! Този списък и информацията в него може да са непълни, неточни или остарели. Възможно е да излизат нови издания с поправки и допълнения. За обновления следете уеб страниците, фейсбук групата „Универсален изкуствен разум“, Ютюб каналите, Дискорд сървъра и др.

Можете да помогнете за подобрението на съществуващите и за осъществяването на бъдещите разработки.

Свещеният сметач призовава съюзници, съмишленици, съдружници и сътрудници; университети, изследователски институти и фирми; учени, инженери, разработчици и творци; спомоществователи, дарители, последователи, другари, изследователи и съавтори за продължения и подобрени версии и за развитие на дейността на изследователско-творческото дружество.

Ако искате да помогнете, за конкретни идеи вижте в началото на основния том, в приложение *Листове,* в информацията за проекта **Вседържец** или *се свържете с мен*.

Всякаква съвременна техника за *нова*[1] изследователска дейност би ни била от полза в работата, както и достъп до облачни услуги от всякакъв вид – от достъп до пораждащи модели като ChatGPT, Gemini, LangChain, до сървъри, дисково пространство и пр. Помещения за техника и работа също може да са полезни.

Съхраняването на българската и световна компютърна история и памет е част от дейността на *Сметача* още от зората му през 2000 г.

Стара българска и световна изчислителна техника, която искате да дарите, също е добре дошла при нас или при сбирки, на които сътрудничим.

[1] Мислещата машина Вседържец работи на такава техника, с каквато разполагаме и се вмества в нея. Ако не можем да осигурим друго, Вседържец ще трябва да се справи и на едно или няколко PC-та, лаптопи и по-малки компютри, с възможна връзка и към мобилни устройства за сензори и други помощни обработки; без или със достъп до Интернет и облачни услуги, каквито можем да си позволим. Виж *„Сингулярност на Тош“ – уравнението на относителната ефективност* в приложение *„Първата модерна стратегия…“*

*** Topics:** Lifelong Learning, Continual Learning, Reinforcement Learning (historical Q-Learning, modern Deep Q-Learning DNN: Atari DeepMind …), RL for LLMs, policy optimizations (DPO, PPO, OREO) … Conditional Random Fields (CRF); Chain-of-Thought prompting …

Houdini: Lifelong learning as program synthesis. Lazar Valkov, Dipak Chaudhari, Akash Srivastava, Charles Sutton, and Swarat Chaudhuri. Advances in Neural Information Processing Systems, 31, 2018,

Modular Lifelong Machine Learning, Lazar Ignatov Valkov, 2022/2023, PhD Thesis, Institute for Adaptive and Neural Computation School of Informatics University of Edinburgh – **Continual learning**, Lifelong Machine Learning (LML), split the NN into modules; solve a sequence of problems, one at a time; HOUDINI – modular neurosymbolic framework for modular LML, program synthesis to select a suitable neural architecture; probabilistic search framework – PICLE for module combinations. Three contributions: reducing the number of examples for learning (better generalization), extend the scope of solved problems with learning and making it easier to understand how the knowledge is being reused.

CNN; DeepMind; … “Off-Policy” method, meaning its Q values are updated assuming that the best action was chosen, even if the best action was not chosen”
*** Q-Learning**, CHRISTOPHER J.C.H. WATKINS, 1992
https://link.springer.com/content/pdf/10.1007/BF00992698.pdf
Model-free RL; “*Asynchronious dynamic programming*” (async. DP), act optimally in Markovian domains … action-replay process (ARP);
* Watkins, C.J.C.H. (1989). **Learning from delayed rewards.** PhD Thesis, University of Cambridge, England.
https://www.researchgate.net/publication/33784417_Learning_From_Delayed_Rewards
“behavioral ecology, stochastic DP for calculating animals’ optimal behavioral policies… performance criterium, efficiency.; optimal learning; learning of efficient strategies – which “lever” gives the higher reward on average (“two-armed bandit”) …
– “Гл.1. Обучението в поведение, което се възнаграждава е признак за интелигентност, напр. естествено е да се обучи куче чрез награждаване, когато отговаря по подходящ начин на команди. … Странно е обаче, че този тип обучение е бил в голяма степен пренебрегнат в когнитивната наука, поради което *не познавам дори и една статия за интелигентността на животните, която да е била публикувана в основния поток на литературата по „изкуствен интелект*“. …“общ подход за обучение чрез награди и наказания, който може да се приложи върху широко множество от ситуации …“
Аргумент за оптималност на поведението, за да оцелява – но критики, че се отнася за животното и поведението му като цяло, а не за всяка подробност…

Бел. Тош: 1: И също в сравнение с други; не най-доброто, а просто *по-добро, достатъчно добро,* така че системата да продължи да съществува или тя да продължи, а не другата. Така и „оцелява най-приспособеният“ по Дарвин е погрешно. Оцелява *достатъчно приспособеният*, което също така е тавтология и тривиалност: ако не издържаш на дадена температура, не можеш да дишаш под вода, а е нужно да дишаш, за да живееш и т.н., няма да оцелееш под вода. Интересното е *кой е приспособен, защо, как се приспособява, защо*. Случайните мутации не обясняват почти нищо, „пробвай и ще видиш“ – защо се случват точно в даден момент, кои се случват и т.н.). 2: В човешки условия наградата според обучителя не винаги е тази, която обучаваният възприема по този начин. Виж критиката на „Marshmallow Test” от Т.Арнаудов в статията в

приложенията в основния том*. RL по учебниково определение връща *скаларна награда*, само една стойност, и може би тази особеност е привлекателна, защото опростява задачата и дава едно решение. Сложните агенти като човеци обаче в „свободно състояние“ нямат задължително единична проста функция на ползата, затова и често изглеждат „*нерационални*“, когато оценителят се опита да ги сведе до скаларна функция, понеже поведението им се разминава с очаквана предполагаема опростена траектория, която допуска само една награда и/или погрешна функция на ползата.

*** Отложеното възнаграждение е заблуждаващо понятие,** Тодор Арнаудов, „Изкуствен разум“ – Artificial Mind, 27.6.2018 (Виж разширена версия на български в края на основния том, след 1832 с. в редакцията към 19.8.2025) или на английски в блога:

https://www.computer.org/csdl/magazine/co/1976/05/01647359/13rRUxBrGku … *"The*

development of techniques for the computer analysis of pictures and scenes began over 20 years ago. Most of the work in this field has been application-oriented; some of the major applications areas are automation (robot vision), cytology, radiology, high-energy physics, remote sensing, and document processing (character recognition)". However, many of the techniques and algorithms are more general than their original application. *"The goal of picture (or scene) analysis is the extraction of a description from the given picture. This description may consist of a set of numerical data (feature measurements), or it may be some type of data structure which represents relationships among significant parts (segments) of the picture, as well as properties of these parts. Thus in general, picture analysis involves segmentation of the picture into parts; measurement of properties of the parts (including both grayscale-dependent properties such as texture, and geometrical properties such as size and shape); and determination of relations among the parts. In addition, it may be desirable to „preprocess" the picture-i.e., to modify it so as to make the subsequent analysis steps easier or more reliable.* ***This paper reviews some of the early milestones in picture recognition and scene analysis techniques.*** *Topics covered include preprocessing (noise cleaning, deblurring, filtering); segmentation (region growing, decomposition of regions into parts, grouping of regions into „objects"); property measurement (invariant properties, textural properties); shape analysis (local shape features, boundary and skeleton representations); and structural analysis (syntactic analysis, model matching). The emphasis is on describing representative ideas that are of* ***historical importance****, rather than on giving a systematic treatment of the subject. "* p.8 **Local shape features**: Closed contour: Bay, Convex corner, Spur, Peninsula, Concave corner, Notch; Contour of a band/a path with two approximately parallel contour lines: End, Branching, Crossing … skeleton or medial axis; chord statistics: intersections with families or lines or line segments; perimeter of the convex hull … boundaries & parametric equations; Fourier descriptors; *Chain code – sequence of horizontal, vertical or diagonal moves of length 1 or SQRT(2)* (vector drawing step-by-step, tracking). Outlining, deblurring … Segmentation: homomorphic filtering, run trakcing and shrinking: intersections, merges, splits, size changes.; minimum-area circumscribed rectangle … linking, normalization by autocorrelation; Moments … double integrals … texture: *coarseness: the size of "pieces", "elements" and directionality – variation of the coarseness as a f(direction)* … ***1950s - rate of falloff of the texture's autocorrelation*** *or of the power of the spectrum as one moves away from the origin* (shifting)*…* ***Early 1960s*** *– statistical approach – P(particular pairs of gray levels in relative position (u,v)). … Transition probability matrices* … second-order transition probabilities are affected by the first order … **Preprocessing**: normalize the grayscale – region growing, Grouping regions into "objects; … autocorrelation; textures geometrical; **curve**: slope, arc length … Structural Analysis – syntactic approach – e.g. strokes in handwriting. *Higher-level knowledge e.g. object models …*

Вероятностните модели на естествени изображения обикновено се оценяват непряко чрез задачи като премахване на шума и рисуване на маскирани части. По-пряк начин за оценка на пораждащ модел е да се извлекат проби от него и да се провери дали статистическите свойства на пробите съвпадат със статистиката на естествените изображения. Този метод рядко се използва с изображения с висока разделителна способност, тъй като настоящите модели произвеждат проби, които са много различни от естествените изображения, както се оценява дори чрез проста визуална проверка. Ние изследваме причините за този неуспех и показваме, че чрез разширяване на съществуващите модели, така че да има два набора от латентни променливи, единият набор моделира интензитета на пикселите, а другият набор моделира ковариациите на пикселите, особени за изображението, можем да генерираме изображения с висока разделителна способност, които изглеждат много по-реалистични от преди. Цялостният модел може да се тълкува като затворено поле на Марков (MRF – Markov Random Field) , където както зависимостите по двойки, така и средните интензитети на пикселите се модулират от състоянията на скритите променливи. И накрая, потвърждаваме, че ако забраним споделянето на теглото между рецептивни полета, които се припокриват едно с друго, затвореният MRF научава по-ефективни вътрешни представяния, както е показано в няколко задачи за разпознаване.

a gated MRF + several hidden Deep Belief Network layers (binary) – performs "comparably to SIFT descriptors". *"Най-популярният начин за използване на вероятностни модели в компютърното зрение – първо да се извлекат описатели на свойствата на малки области от изображението или части от обекти чрез добре проектирани признаци, и след това да се използват средства за статистическо обучение, за да се моделират зависимостите между признаците и вероятните етикети. В тази работа използваме един от най-добрите пораждащи модели на ниво пиксели – поле на Марков с клапи* - като най-ниско ниво на дълбока мрежа на убежденията (deep belief network), с няколко скрити слоя." Ръчно проектираните признаци: SIFT, HoG (Histogram of Oriented Gradients), SURF, PhoG – описват късчета, малки области от изображението и ги натрупват в рзлични пространствени разделителни способности и по различни части от изображението, за да образуват вектор на признаците, които след това се подава на класификатор с общо предназначени като SVM (Support Vector Machine). Въпреки, че са много успешни, тези методи разчитат твърде много на човешки дизайн на извличането и на обединяването им в общ вектор. При големият и нарастващ брой на лесно достъпни изображения и напредъкът в машинното обучение, би трябвало да бъде възможно да се научат по-добри описатели на късчетата и по-добър начин за обединяването им.*
Fast Persistent Contrastive Divergence (FPCD). "Целта на обучението е да се намерят параметрите на първия слой (C, M, γ b1) и на по-високите (Wi, bi), които увеличават вероятността на образите от обучението. Towards this goal, we introduce a general method for learning ordered representations, .. hypernym prediction and image-caption retrieval. p.1 Computer vision and natural language processing are becoming increasingly intertwined. … future, autonomous artificial agents will need to* ***jointly model vision and language*** *in order to parse the visual world and communicate with people. Example: "woman skiing" – skis – entity; skiing – woman – person – entity; woman walking her dog – woman walking – person walking – person – entity; dog – entity … p.2 Much of the expressive power of human language comes from abstraction and composition.*

*** Instance Normalization: The Missing Ingredient for Fast Stylization, Dmitry Ulyanov, Andrea Vedaldi, Victor Lempitsky,** 27.6.2016/6.11.2017 Computer Vision Group at Skoltech & Yandex Russia, Visual Geometry Group University of Oxford United Kingdom https://arxiv.org/abs/1607.08022 .. *swapping batch normalization with instance normalization … Gatys et al. (2016) introduced a method for transferring a style from an image onto another one, as demonstrated in fig. 1. The stylized image matches simultaneously selected statistics of the style image and of the content image. Both style and content statistics are obtained from a deep convolutional network pre-trained for image classification. The style statistics are extracted from shallower layers and averaged across spatial locations whereas the content statistics are extracted form deeper layers and preserve spatial information. In this manner, the style statistics capture the "texture" of the style image whereas the content statistics capture the "structure" of the content image.* However it is inefficient, using iterative optimization until it matches the desired statistics, taking *several minutes to stylize an image of size 512 × 512.* The new method: comparable quality but generated in real time. Style image x0 to learn a generatr network g(x,z). **Interesting:** *While the generator network g is fast, the authors of Ulyanov et al. (2016) observed that learning it from too many training examples yield poorer qualitative results. In particular, a network trained on just 16 example images produced better results than one trained from thousands of those. ..* style loss, transfer elements from a style image to the content image such that the contrast of the stylized image is similar to the contrast of the style image.

https://pytorch.org/docs/stable/generated/torch.nn.InstanceNorm2d.html

*** LayerNorm …**

https://en.wikipedia.org/wiki/Normalization_(machine_learning)
https://en.wikipedia.org/wiki/Normalization_(machine_learning)#Local_response_normalization

– *1.* ***data*** *normalization, 2.****activation*** *normalization*. 1: feature scaling: same range, mean, variance etc.; min-max normalization, sclae, e.g. [0,1] [-1,1]. https://en.wikipedia.org/wiki/Feature_scaling – **Rescaling** (min-max normalization) x'=(x-min(x))/(max(x)-min(x)) … (cmp: Lerp, linear interpolation in shader languages: HLSL, GLSL etc.); mean normalization: x' = (x-avgx)/(max(x)-min(x)) avgx = average(x) – the mean of the feature vector. Another kind of "means normalization" – standardization – divides by the standard deviation:

*** Standardization, Z-score Normalization**. x' = (x-avgx)/sigma; sigma = σ = standard deviation. ***Robust scaling:*** *using median and interquartile range (IQR) – designed to be robust to outliers. It scales the features using he median and IQR as reference points, instead of the mean and stddev.* x'=(x-Q2(x))/(Q3(x)-Q1(x)); Q1(x), Q2(x), Q3(x) are 3 quartiles (25^{th},50^{th}, 75^{th} percentile) of the features.

*** Unit vector normalization –** each individual data point is regarded as a vector and is divided by its vector norm to obtain x' = x/||x||. Any vector norm: usually L1 and L2. If x = (v1, v2, v3), Lp-normalized = $(v1/(|v1|^p, |v2|^p, |v3|^p)^{1/p}$, $v2/(|v1|^p, |v2|^p, |v3|^p)^{1/p}$, $v3/(|v1|^p, |v2|^p, |v3|^p)^{1/p})$

* https://en.wikipedia.org/wiki/Outlier – *a data point that differs significantly from other observations.*

[**Tosh**: However at the time of evaluation-observation the data point is classified or attributed as belonging to the same group, selection, dataset, class etc. Thus a signal is required that another segmentation/division is required – more groups, subspaces for more appropriate/precise classification, addressing, representation. The signal could be an error, a feature, abuffer underrun or overrun/oversize/undersize/threshold etc.]

*** Criteria for deciding is a data point an outlier**: *Chauvenet's criterion Chauvenet%27s_criterion – around the center of a normal distribution; mean and stddev … , Grubbs's test for outliers Dixon's Q test, ASTM E178: Standard Practice for Dealing With Outlying Observations, Mahalanobis distance and leverage, Subspace and correlation based techniques for high-dimensional numerical data, Pierce's, Tukey's fences; Anomaly detection – distance-based or density-based (**Local Outlier Factor LOF** – local density, where locality is given by k nearest neighbors, Local_outlier_factor), Modified Thompson Tau test,* … What to do with outliers? Retention or Exclusion. Non-normal distributions – "fat tails", Cauchy distribution … Set-membership **uncertainties** (instead of a probability density function); hierarchical Bayes model, or a mixture model

https://en.wikipedia.org/wiki/Unit_of_observation#Data_point – The unit of observation should not be confused with the unit of analysis. *a **unit of observation** is the unit described by the data that one analyzes. A study may treat groups as a unit of observation with a country as the unit of analysis, drawing conclusions on group characteristics from data collected at the national level. ..*
*A **data point** or **observation** is a set of one or more measurements on a single member of the unit of observation.* Level_of_analysis - in social sciences: location, size, or scale of a research target; the context/framework… [**Tosh:** this concept can be applied for every domain: resolution of causality-control and perception, see Theory of Universe and Mind). Unit_of_analysis - *the **entity** that frames what is being looked at in a study, or is the **entity** being studied as a whole; the **‚actor'** or the ‚entity' to be studied". The unit of observation is a subset of the unit of analysis.* Statistical_unit – *a **unit** is a member of a set of entities being studied – a „random variable", e.g. a single person, animal, plant, manufactured item, or country that belongs to a larger collection of such entitites being studied.* (experimental, sampling) unit. Unit_of_measurement or unit of measure – a definite magnitude of a quantity .. (e.g. metre for length, gram for weight, second for time).
* Data_type | Observational_error – *the difference between a measured value of a quantity and its unknown true value* | Statistical_parameter - a **parameter** is any quantity of a statistical population that summarizes or describes an aspect of the population, such as a mean or a standard deviation. .. Elementary_event – atomic event or sample point – an event which contains only a single outcome in the sample space – mutually exclusive, collectively exhaustive, the right granularity .. Multiple sample spaces. **Atom** (measure theory) – A measurable set with positive measure that contains no subset of smaller positive measure. Outcome_(probability) – a possible result of an experiment or trial.[1] Each possible outcome of a particular experiment is unique, and different outcomes are mutually exclusive (only one outcome will occur on each trial of the experiment). All of the possible outcomes of an experiment form the elements of a sample space..

Probability band – https://en.wikipedia.org/wiki/Confidence_and_prediction_bands

Confidence and prediction bands https://en.wikipedia.org/wiki/Prediction_interval https://en.wikipedia.org/wiki/Novelty_detection **–** *identify an incoming sensory pattern as being hitherto unknown. .. The reverse phenomenon is habituation, i.e., the phenomenon that known patterns yield a less marked response.*

Tosh: What is unknown, how it is decided? Degrees, criteria, contexts etc.

* Winsorizing – limiting extreme values in the statistical data to reduce the effect of possibly spurious outliers. Compare: Trimmed_estimator – *a **trimmed estimator** is an estimator derived from another estimator by excluding some of the extreme values, a process called truncation. This is generally done to obtain a more robust statistic, and the extreme values are considered outliers. Given an estimator, the x% trimmed version is obtained by discarding the x% lowest or highest observations or on both end: it is a statistic on the middle of the data. The median is preserved.* Estimator *– a rule for calculating an estimate of a given quantity based on observed data: thus the rule (the estimator), the quantity of interest (the estimand) and its result (the estimate) are distinguished.*[1] .. the sample mean *is an estimator of the population mean. .. point and interval estimators. The point estimators yield single-valued results. This is in contrast to an interval estimator, where the result would be a range of plausible values.* ***Quantified properties: error, mean squared error MSE, Sampling deviation, Variance, Bias …*** Censoring_(statistics) – out of bounds measurements, it may be known that the value is above or below a threshold, but not how much exactly | Maximum_and_minimum | Truncation_(statistics) | Censoring_(statistics)
Fat-tailed_distribution – Cauchy etc. – https://en.wikipedia.org/wiki/Cauchy_distribution – *the canonical example of a „pathological“ distribution since both its expected value and its variance are undefined. The mean and stddev does not converge, unlike in the normal distribution:https://en.wikipedia.org/wiki/Cauchy_distribution#/media/File:Mean_estimator_consistency.gif | Normal_distribution* – **Gaussian distribution**

*** Network In Network,** Min Lin1,2, Qiang Chen2, Shuicheng Yan2, 2014, National University of Singapore – *a novel deep network structure called "Network In Network"(NIN) to enhance model discriminability for local patches within the receptive field.* …
1x1 Convolution

*** Talented Mr. 1X1: Comprehensive look at 1X1 Convolution in Deep Learning,** Raj Sakthi, 13.1.2020 https://medium.com/analytics-vidhya/talented-mr-1x1-comprehensive-look-at-1x1-convolution-in-deep-learning-f6b355825578 depth of the input matrix – number of channels (e.g. RGB: 3 channels, depth = 3, e.g. 64x64x3); usually the filters have the same depth as input… The 1x1 Conv *reduces the number of channels while introducing non-linearity*. 64x64x3 → 64x64x1. Dimensionality reduction = Cross channel down-sampling. *The Winner of ILSVRC (ImageNet Large Scale Visual Recognition Competition) 2014,* ***GoogleNet, used*** *1X1 convolution layer for* ***dimension reduction*** *"to compute reductions before the expensive 3×3 and 5×5 convolutions" ..* "***Inception Module***" – reduces the computation 10 times. ***Usage 2: Building DEEPER Network ("Bottle-Neck" Layer)*** *2015 ILSVRC Classification winner,* ***ResNet,*** *had least error rate and swept aside the competition by using very deep network using 'Residual connections' and 'Bottle-neck Layer'. .. *** Dan Ciresan –** *PhD from "Politehnica" University of Timisoara, Romania. He first worked as a postdoc before becoming a senior researcher at IDSIA, Switzerland. Dr. Ciresan is one of the pioneers of using CUDA for Deep Neural Networks (DNN). His methods have won five international competitions on topics such as classifying traffic signs, recognizing handwritten Chinese characters, segmenting neuronal membranes in electron microscopy images, and detecting mitosis in breast cancer histology images. Currently, he continues his research with DNN at Conndera Research; Founder of Conndera Research in 2016. Romania and Switzerland.* https://people.idsia.ch/~ciresan/

* **ImageNet** https://en.wikipedia.org/wiki/ImageNet *2010: 11 participating teams, the winning team: a linear SVM; a dense grid of HoG and LBP, sparsified by local coordinate coding and pooling. 52.9% in classification accuracy and 71.8% in top-5 accuracy; trained for 4 days on three 8-core machines (dual quad-core 2 GHz Intel Xeon CPU). The second competition in 2011 had fewer teams, with another SVM winning at top-5 error rate 25%.[10] The winning team was XRCE by Florent Perronnin, Jorge Sanchez. A linear SVM, running on quantized[36] Fisher vectors.[37][38], 74.2% top-5 accuracy. In 2012, a deep convolutional neural net called AlexNet achieved 84.7% in top-5 accuracy, a great leap forward.[39] In the next couple of years, top-5 accuracy grew to above 90%. While the 2012 breakthrough „combined pieces that were all there before", the dramatic quantitative improvement marked the start of an industry-wide artificial intelligence boom.*

*** Automatic detection of concrete cracks from images using Adam-SqueezeNet deep learning model,** Lin Wang, Hefei University, Hefei, Anhui Province, 230061, China

Bag-of-words_model_in_computer_vision – Bag of visual words (BoW), Content based image indexing and retrieval (CBIR); features such as SIFT, vecror dim=128; **codewords, codebook generation**; local patches. *One of the notorious disadvantages of BoW is that it ignores the spatial relationships among the patches, which are very important in image representation. ..* Naïve Bayes **.. probabilistic latent semantic indexing (PLSI)**
Probabilistic_latent_semantic_analysis – *Compared to standard latent semantic analysis which stems from linear algebra and downsizes the occurrence tables (usually via a singular value decomposition), probabilistic latent semantic analysis is based on a mixture decomposition derived from a latent class model.* Structural_equation_modeling * https://en.wikipedia.org/wiki/Latent_class_model **–** *clustering multivariate discrete data. It assumes that the data arise from a mixture of discrete distributions, within each of which the variables are independent.* | Fisher_kernel – a function that measures the similarity of two objects on the basis of sets of measurements for each object and a statistical model. | Segmentation-based_object_categorization – partitioning an image into multiple regions according to some homogeneity criterion. Graph … Normalized cuts .. Part-based_models - constellation and non-constellation based … mean face, deformable … 35 elements, 100 elements … deviations from a mean face: shape, orientation, gray level … minimization of an error function … template matching Elastic_matching Graphical_time_warping , Dynamic_time_warping – measuring similarity between two temporal sequences, which may vary in speed. See also: Sequence alignment | Multiple sequence alignment etc: Levensthein distance, Wagner-Fischer algortihm, Needleman-Wunsch algorithm, Fréchet distance – a measure of similarity between curves that takes into account the location and ordering of the points along the curves .. Nonlinear mixed-effects model .. Constellation_model – a probabilistic, generative model for category-level object recognition .. attempts to represent an object class by a set of N parts under mutual geometric constraints. Because it considers the geometric relationship between different parts, the constellation model differs significantly from appearance-only, or „bag-of-words“ representation models, which explicitly disregard the location of image features. .. https://en.wikipedia.org/wiki/Feature_(computer_vision)#Detectors – feature (detection,extraction); Neighborhood_operation; **feature** (image, vector, space, types(**edge**(gradient magnitude, boundary; arbitrary shape, junctions), (**corner**/**interest points**(curvature,…), **blobs**(regions; smoother than edges. Scale: LoG, DoH blob detectors *Laplacian of Gaussian & Difference of Gaussians*), ridges(elongated)). Feature detection: Canny, Sobel, Harris & Stephens/Plessey, SUSAN, Shi & Thomas, Level curve curvature, FAST, Laplacian of Gaussian, Difference of Gaussians, Determinant of Hessian, Hessian strengh feature measure, **MSER**, Principal curvature ridges, Gray-level blobs, * **SIFT** - Scale-invariant_feature_transform

* **Object recognition from local scale-invariant features, David G Lowe, 1999** https://www.cs.ubc.ca/~lowe/papers/ijcv04.pdf ***In the current implementation, each image generates on the order of 1000 SIFT keys, a process that requires less than 1 second of computation time …*** **p.*2 Related work: Many candidate feature types have been proposed and explored, including line segments [6], groupings of edges [11, 14], and regions [2], among many other proposals. … worked well for certain object classes,* but *.. not detected frequently enough or with sufficient stability to form a basis for reliable recognition*. Key localization *.. identify locations in image scale space that are invariant with respect to image translation, scaling, and rotation, and are minimally affected by noise and small distortions ..* p.3*"Maxima and minima of this scale-space function are determined by comparing each pixel in the pyramid to its neighbours. First, a pixel is compared to its 8 neighbours at the same level of the pyramid. If it is a maxima or minima at this level, then the closest pixel location is calculated at the next lowest level of the pyramid, taking account of the 1.5 times resampling. If the pixel remains higher (or lower) than this closest pixel and its 8 neighbours, then the test is repeated for the level above. Since most pixels will be eliminated within a few comparisons, the cost of this detection is small and much lower than that of building the pyramid"* [Tosh: Compare with ANN, CNN. The series of convolutions and resolution reduction serve as Gaussian pyramids and coverage of the scale space; the pooling layers (max-pooling) and activation function select extrema.] *Harris corner detectors for inerest points .. canonical orientation.. eigenspace matching, color histograms, and receptive field histograms .. cluttered images, .. – many small local eigen-windows, but expensive search .. dense local features (e.g., Schmid & Mohr [19])*

David Lowe, Fitting Parameterized Three-Dimensional Models to Images, 1991, https://faculty.nps.edu/oayakime/ADSC/Scoring%20-%20Lowe%20-%20Fitting%20Parameterized%20Three-Dimensional%20Models%20to%20Images.pdf *"Model-based recognition and motion tracking depends upon the ability to solve for projection and model parameters that will best fit a 3-D model to matching 2-D image features"*

* **DeepFace –** DL facial recognition system, Facebook, 2014; released 2015. https://en.wikipedia.org/wiki/DeepFace 9-layer ANN, 120 million connection weights, trained on 4 million images of FB users. *"The Facebook Research team has stated that the DeepFace method reaches an accuracy of 97.35% ± 0.25% on Labeled Faces in the Wild (LFW) data set where human beings have 97.53%" … four modules:* ***2D alignment, 3D alignment, frontalization, and neural network.*** *An image of a face is passed through them in sequence, resulting in a 4096-dimensional feature vector representing the face. .. to identify the face, one can compare it against a list of feature vectors of known faces, and identify the face with the most similar feature vector. DeepFace uses fiducial point detectors based on existing databases to direct the alignment of faces. The facial alignment begins with a 2D alignment, and then continues with 3D alignment and frontalization. That is, DeepFace's process is two steps. First, it corrects the angles of an image so that the face in the photo is looking forward. To accomplish this, it uses a 3-D model of a face. 2D – 6 fiducial points; 3D: 67 alginment points; input: 152x152 RGB, output: dim=4096; in the 2014 paper: also a FC 4030-dim. Layer for 4030-persons classification.*

* https://en.wikipedia.org/wiki/FaceNet – a mapping (also called an embedding) from a set of face images to a 128-dimensional Euclidean space; Triplet_loss (anchor-negative-positive) – *The triplet loss function minimizes the distance between an anchor and a positive, both of which have the same identity, and maximizes the distance between the anchor and a negative of a different identity.* FindFace – 2016, Ntech Lab, Russia https://findface.pro/

Kahan_summation_algorithm |)… | Difference_of_Gaussians – a feature enhancement algorithm that involves the subtraction of one Gaussian blurred version of an original image from another, less blurred version of the original. In the simple case of grayscale images, the blurred images are obtained by convolving the original grayscale images with Gaussian kernels having differing width (standard deviations); it is *an approximation of the Mexican hat kernel function used for the Laplacian of the Gaussian operator. As a feature enhancement algorithm, the difference of Gaussians can be utilized to increase the visibility of edges and other detail present in a digital image.* Morlet_wavelet – a wavelet composed of a complex exponential (carrier) multiplied by a Gaussian window (envelope). This wavelet is closely related to human perception, both hearing[2] and vision. Pyramid_(image_processing)#Gaussian_pyramid – a type of multi-scale signal representation developed by the computer vision, image processing and signal processing communities, in which a signal or an image is subject to repeated smoothing and subsampling. Pyramid representation is a predecessor to scale-space representation and multiresolution analysis (MRA) or multiscale approximation (MSA) – *is the design method of most of the practically relevant discrete wavelet transforms (DWT) and the justification for the algorithm of the fast wavelet transform (FWT). It was introduced in this context in 1988/89 by Stephane Mallat and Yves Meyer and has predecessors in the microlocal analysis in the theory of differential equations (the ironing method) and the pyramid methods of image processing as introduced in 1981/83 by Peter J. Burt, Edward H. Adelson and James L. Crowley. …* Self-similarity in time, Self-similarity in scale, In the sequence of subspaces …, Regularity, linear hull

Completeness, nested subspaces fill the whole space … Wavelet – wave-like oscillation with an amplitude that begins at zero, increases or decreases, and then returns to zero one or more times. Wavelets are termed a „brief oscillation“. … Gaussian_blur .. Ronchi_ruling – *a constant-interval bar and space square-wave optical target or mask. The design produces a precisely patterned light source by reflection or illumination, or a stop pattern by transmission, with precise uniformity, spatial frequency, sharp edge definition, and high contrast ratio. .. a precise signal for testing resolution, contrast, distortion, aberrations, and diffraction in optical imaging systems.* 1951_USAF_resolution_test_chart Halftone – photographic screening, only black dots on white paper, 19-th century method for printing photography; halftone dots – from a sufficient distance the shades look smooth, continuous. Continuous_tone_image – each color at any point in the image can transition smoothly between shades, rather than being represented by discrete elements such as halftones or pixels. | Hough_transform - lines, circles | Harris_corner_detector | Canny_edge_detector | Sobel_operator | Deformable,

parametrized shapes | Active contours (snakes) Active_contour_model – energy minimizing, deformable spline; constraint and image forces that pull it towards object contours and internal forces that resist deformation; the external energy term is to control the fitting of the contour onto the image. Signed_distance_function **(SDF)** or **signed distance field** *~ Level Set Function; see Computer Graphics, 3D objects modeling by the boundaries, ray marching. ..* Active contour model is related to Graph cuts, or max-flow/min-cut – a generic method for minimizing the Markov random field (MRF) energy. Boundary_vector_field | Markov_random_field → Sherrington–Kirkpatrick model Spin_glass#Sherrington%E2%80%93Kirkpatrick_model

* **Image Segmentation using Active Contours (Snake)** Vignesh Gopalakrishnan**,** 10.1.2024, *Level Set Function (LSF) - a binary array, with specific regions marked as -1 to represent an initial estimate of the object's boundary. Curve Evolution: energy computations, curvature analysis, gradient calculations, and LSF updates. The contour evolves to fit the object boundaries better over multiple iterationss; parameters: mu, nu, epsilon, step, number of iterations; energy: elastic, bending, external. Elastic: remain close to the original shape, penalizing deviations. Bending: penalizes curvature, sharp bends or kinks – encourages smoothness. External … Automatic initialization.* https://en.wikipedia.org/wiki/Corner_detection#The_level_curve_curvature_approach https://en.wikipedia.org/wiki/Features_from_accelerated_segment_test (FAST) - corner detection: AST corner detector uses a circle of 16 pixels (a Bresenham circle of radius 3) https://en.wikipedia.org/wiki/Midpoint_circle_algorithm https://en.wikipedia.org/wiki/Blob_detection#The_Laplacian_of_Gaussian … https://en.wikipedia.org/wiki/Ricker_wavelet (Mexican hat wavelet, Marr wavelet) https://en.wikipedia.org/wiki/Scale_space | https://en.wikipedia.org/wiki/Ridge_detection - connector set, valleys, relative critical set … **Wavelet Transform:** https://en.wikipedia.org/wiki/Wavelet_transform - *The fundamental idea of wavelet transforms is that the transformation should allow only changes in time extension, but not shape, imposing a restriction on choosing suitable basis functions.*Wavelet coefficients, wavelet filters, length; JPEG2000 .. *First a wavelet transform is applied. This produces as many coefficients as there are pixels in the image (i.e., there is no compression yet since it is only a transform). These coefficients can then be compressed more easily because the information is statistically concentrated in just a few coefficients. This principle is called transform coding. After that, the coefficients are quantized and the quantized values are entropy encoded and/or run length encoded. Transform_coding | Square-integrable_function* – the integral of the square of the function is finite, < infinity; for wave functions: Fourier, Wavelets, Quantum wave functions – can be described as a sum of a series of orthogonal functions (decomposition of independent components), L^2 norm can be applied, Cauchy sequences converge in that space etc.

Tosh: Study, see, observe, explore: various low-poly models with flat shading and/or wireframe rendering mode or both in order to clearly see the triangles, vertices, edges. See especially voxel models or voxel 3D-editors like Blender, Magica Voxel and online. You will notice yourself the set of possible edges, connections, occlusions etc. which are enumerated and studied in this and the other related works from Guzman, Mackworth**,** Kanade etc.
Magica Voxel: https://ephtracy.github.io/ and Magica Voxel Viewer. Turn on the borders or select such models. When in **Rendering mode**, notice how the shape, depth and the surface relations and geometry are evident from the start with real time rendering at high frame rate. The *complete* rendering with light in high quality takes many times more resources, but the *qualitative* difference, regarding the "*substantial*" and most *important* information about the *geometry* and the *topology,* compared to to the previous and the early stages, becomes progressively smaller. This is obvious in the history of computer graphics as well, demonstrated by the evolution of the video games. In 3D there is steep progress from the early attempts with vector graphics, polygons with a few triangles or lines, sometimes without hidden lines removal. Then flat shaded models with a few triangles; then simple texture mapping, progressively higher polygon models and more complex light and visual effects etc. Since Playstation 3 or 4 the improvement gets less impressive or dramatic and there are PC games from about 2003-2004 which still are aesthetically pleasing*. For example, the higher performance raytracing, introduced with Nvidia RTX 2000 series in 2018 initially failed to attract the expected attention.
* More "formally" put, they are "good enough" to pass the test of time, i.e. the improvement of the newer generations. That could be said for 2D games as well. In my personal taste that includes even games for NES such a Contra 50etc.

*** Guzman, Adolfo. (1968) Decomposition of a visual scene into three-dimensional bodies.** Proc. of the Fall Joint Computer Conference, pp. 291-304. https://dl.acm.org/doi/pdf/10.1145/1476589.1476631 The program **SEE.**
We consider visual scenes composed by the optical image of a group of bodies. When such a scene is „seen" by a computer through a film spot scanner, image dissector, or similar device, it can be treated as a two-dimensional array of numbers, or as a function of two variables. At a higher level, a scene could be meaningfully described as a conglomerate of points, lines and surfaces, with properties (coordinates, slopes, ...) attached to them. Still a more sophisticated description could use terms concerning the bodies or objects which compose such a scene, indicating their positions, inter-relations, etc. This paper describes a program which finds bodies in a scene, presumably formed by three-dimensional objects.

*Some of them may not be completely visible. The picture is presented as a line drawing. When **SEE**—the pretentious name of the program— analyzes the scene TRIAL (see Figure 1 ‚TRIAL'), the results are: (B0DY1.IS:6:2:1) (BODY2.IS:11:12:10) (BODY3.IS:4:9:5:7:3:8:13)* … See the literature with early work:

https://www.cs.ubc.ca/~mack/Publications/IEEE-PAMI86.pdf *The problem of finding a description, at varying levels of detail, for planar curves and matching two such descriptions is posed and solved in this paper. A number of necessary criteria are imposed on any candidate solution method. Path-based Gaussian smoothing techniques are applied to the curve to find zeros of curvature at varying levels of detail. The result is the* ***"generalized scale space" image of a planar curve which is invariant under rotation, uniform scaling and translation of the curve****. These properties make the* ***scale space*** *image* ***suitable for matching.*** *The matching algorithm is a modification of the uniform cost algorithm and finds the lowest cost match of contours in the scale space images. It is argued that this is preferable to matching in a so-called stable scale of the curve because no such scale may exist for a given curve. This technique is applied to register a Landsat satellite image of the Strait of Georgia, B.C. (manuall corrected for skew) to a map containing the shorelines of an overlapping area. Index Terms-Cartography, computational vision, curve recognition, generalized scale space, map generalization, path-based Gaussian smoothing, remote sensing, shape description, uniform cost algorithm, zeros of curvature. …* ***II. SOME CRITERIA FOR A RELIABLE REPRESENTATION …*** a reliable method and representations for curve description and recognition must be: **a)** efficiently computabe **b)** .. *essentially invariant under rotation, uniform scaling, and translation of the curv ..* ***c)*** *The representation should contain information about the curve at* ***varying levels of detail****. Moreover, it should be clear from the representation* ***which features of the curve belong to coarser levels of detail and which features to finer*** *levels d) The* ***amount of change*** *in the*

representation *should correspond to the amount of change made to the curve. In other words, a small change to part of the curve should create a small local change in the representation.* ***e) Arbitrary choices*** *should not affect the representation.* ***f)*** *In case of open curves intersecting the frame, the representation should only change locally with the location of the cutoff points.* ***g)*** *The representation should uniquely specify a single curve, otherwise it would be possible to match a curve against a class of curves all of which have the same representation. This criterion only requires uniqueness up to the curve equivalence classes induced by requirement b) above. …*
Tosh: The criteria can be applied for all kind of representations at varying scales.

- **The Knowledge Frontier**: **Essays in the Representation of Knowledge**, Book, © 1987 1st edition, Editors: Nick Cercone, Gordon McCalla
https://link.springer.com/book/10.1007/978-1-4612-4792-0 … *Knowledge representation is perhaps the most central problem confronting artificial intelligence. Expert systems need knowledge of their domain of expertise in order to function properly. Computer vlsion systems need to know characteristics of what they are „seeing" in order to be able to fully interpret scenes. Natural language systems are invaluably aided by knowledge of the subject of the natural language discourse and knowledge of the participants in the discourse. Knowledge can guide learning systems towards better understanding and can aid problem solving systems in creating plans to solve various problems. Applications such as intelligent tutoring, computer-aided VLSI design, game playing, automatic programming, medical reasoning, diagnosis in various domains and speech recognition, to name a few, are all currently experimenting with knowledge-based approaches.*

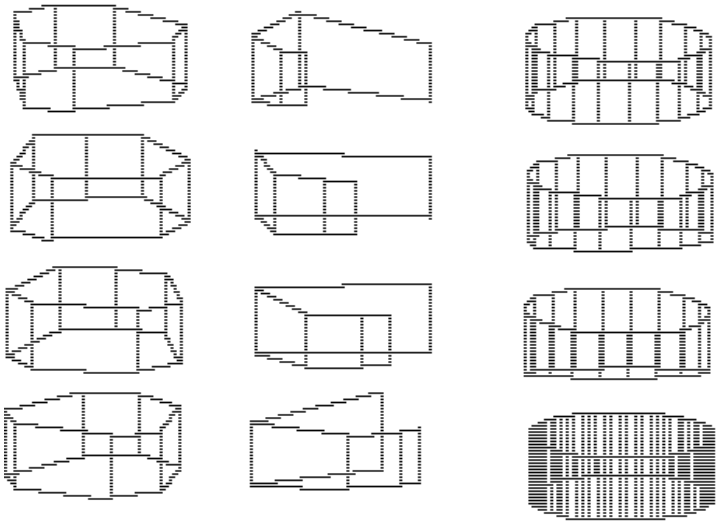
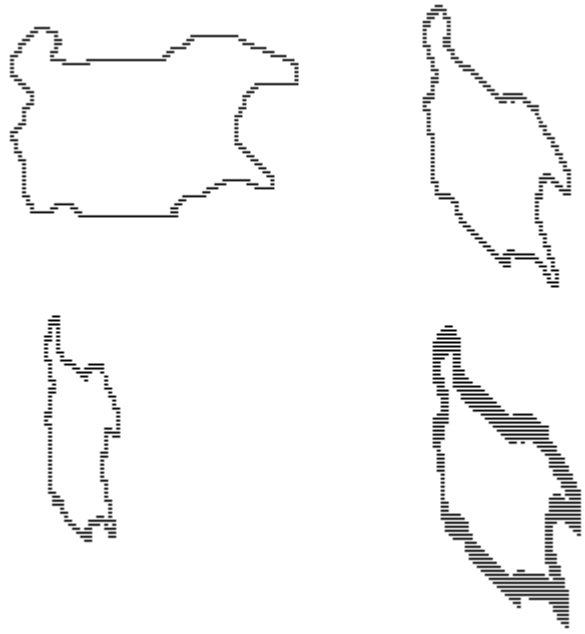
- **Tosh:** See some of the versions of **Trigonometric-3D**, **1999,** 3D-graphics on Pravetz-8M (Apple][clone) where the perspective and rotation were simulated by the excentricity of ellipses and the 3D figures were described in a polar coordinate system as a set of angular coordinates along ellipses. Some weeks later I figured out the formula with the /z of complete three-dimensional cordinates allowing all kinds of transformations.



Ellipses used as perspective gauges in Trigonometric-3D from 6.1999 on Pravetz-8M

Another way for producing depth and an earlier technique from my early technological chronology was called **ART SUPER 98 II** from 1998 – I figured out that by changing **the original step** of one of the coordinate in a contour, the redrawn image would appear rotated.



Now I would add, that the step can be changed in a more complex way, e.g. computing the center of mass, even just by the average coordinate, and/or finding the extremas – the topmost, bottom, leftmost, rightmost points; choosing a center/cutting point at that row or column; tracing/rendering from there and while drawing along the contour, changing the steps of **both**

directions/dimensions with a variable modifiers, either along all steps, or for example the upper half part: multiplied (like it is getting closer to the viewer) and the bottom half part – divided; with quotient 1 in the middle and then diminishing to the "tail".
https://www.oocities.org/todprog/trigo3d.html
* The way in **ART SUPER 98 II** is a kind of **affine transform**. However I didn't know the term at the time, at the age of 13-14.
* The sample vector image is an approximate map of Republic of Bulgaria.

* **Wormholes Improve Contrastive Divergence**, Geoffrey Hinton, Max Welling, and Andriy Mnih, NIPS 2003 https://www.cs.utoronto.ca/~hinton/absps/worm.pdf
Catastrophic divergence with MCMC is when there are multiple modes in the distribution, several high probability regions, separated by low probability density regions (several local maxima with a high density in the PDF and low density areas in between); a bigger range of the step of search for the Markov Chain Monte Carlo is required in order to escape, the wormholes are the short-cuts between these modes/maxima - *mode-hopping … One way to model the density of high-dimensional data is to use a set of parameters, Θ to deterministically assign an energy, E(x|Θ) to each possible datavector, x … The way in which the data distribution gets distorted in the first few steps of the Markov chain provides enough information about how the model differs from reality to allow the parameters of the model to be improved by lowering the energy of the data and raising the energy of the "confabulations" produced by a few steps of the Markov chain" …*
Notes: contrastive divergence: training RBM (energy-based) – start with the input data, single step Gibbs sampling with the hidden units, then sampling the visible units based on the hidden and compare the reconstruction: the difference between the reconstructed distribution is used to update the model's parameters; the energy of the data points is made lower. MCMC samples many steps of the probability distribution until equilibrium, better for multiple modes. Maximum Likelihood Estimation (MLE) – computes the log-likelihood function, Sum(all possible configurations). … Hamiltonian Monte Carlo (Hybrid MC) - Metropolis–Hastings algorithm with a time-reversible & volume-preserving

*** An Overview of the SPHINX-II Speech Recognition System,** Xuedong Huang, Fileno Alleva, Mei-Yuh Hwang, and Ronald Rosenfeld, 1993 – https://aclanthology.org/H93-1016.pdf
Recently SPHINX-II achieved the lowest error rate in the November 1992 DARPA evaluations. For 5000-word, speaker-independent, continuous, speech recognition, the error rate was *reduced to 5%. the testing set has 330 utterances collected from 8 new speakers … "conventional backoff trigram model"* [P(w3| w1 ,w2); backoff – if the trigram wasn't seen in the training data – "backing off" to a bigram or unigram P(w3|w2), P(w3) (Probability of the word (token)). Smoothing – assign small P to unseen n-grams. Trigram Prob. P(w3| w1 ,w2) = count(w1, w2, w3)/count(w1,w2) unigram P(w3) = count(w3)/count(all_words). Additive Laplace smoothing: a small constant (e.g. 1) to each count. Kneser-Ney smoothing: how frequently a word appears in novel contexts. A senone – a basic subphonetic unit, distinct acoustic class – finer grained than phonemes, context-dependent; produced by clustering the state dependent output distributions; classification with a decision-tree, *asking questions in a hierarchical manner.* HMM - decode the most likely sequence of hidden states – sequence of senones, given the acoustic data, which is explicit.

***Sphinx-II System diagram**: Testing Data → Multipass Search(Feature Codebook, Lexicon, HMM Senone, Language Model & Weight) → Reestimation → MFCC Normalized Features and Quantization, Senonic Semi-Continuous HMM, Unified Stochastic Engine } Training Data*

Feature extraction: 12 LPC cepstrum coefficients … HMMs assume each frame is independent of the past [the Markov property] … SPHINX I: 3 codebooks: 1. 12 x LPC (Linear predictive coding) coefficients, 2. 12 differenced LPC cepstrum coefficients (40 msec difference), 3. Power and differenced power (40 ms) … New measures for spectral dynamics, second order differential cepstrum and power $\Delta\Delta x_t(k)$ & third order … t is in units of 10 ms; incorporating both 40 ms & 80 ms differenced cepstrum … mel-frequency cepstral coefficients (MFCC … the final configuration = 51 features in 4 codebooks x 256 entries… the new feature set reduces the errors by > 25% … Semi-continuous HMM (SCHMM), Shared mixtures, … Viterbi beam search (VBS), stack decoding … fast-match, N-best paradigm – simple acoustic & language models, then a multi-pass rescoring. … 3 search phases: left-to-right VBS: word end times, between-words model; & bigram language model; right-to-left VBS → word beginning times … A* search combines the previous two with a long distance language model … A* Stack search, "theory: partial theory, one word extension, time, two scores …

*** From CMU Sphinx-II to Whisper — Making Speech Recognition Usable**, Chapter, pp 481–508. Automatic Speech and Speaker Recognition, X. Huang, A. Acero, F. Alleva, M. Hwang, L. Jiang & M. Mahajan, 1996 –

https://www.microsoft.com/en-us/research/wp-content/uploads/2016/02/tr-94-20.doc – *For 5000 and 20,000-word speaker-independent continuous speech recognition; error: reduced to 5% and 13% … the lowest error rate among all of the systems tested in the November 1992 ARPA spoken language technology evaluationsWindows … One of the most important contributions: the availability of large amounts of training data. "In the Sphinx-II system, for acoustic model training: 7200 utterances of read Wall Street Journal (WSJ) text, 84 speakers (half male and half female) language model training: 45-million words of text by the WSJ. Recently 35,000 utterances of read speech and 400-million words of newspaper text.*" … *"For typical Windows® Command-and-Control applications (less than 1,000 words), Whisper provides a software only solution on PCs equipped with 486DX microprocessors. For 5,000 to 60,000 word continuous speech dictation, it requires an Intel Pentium® or MIPS R4400 class microprocessor. For command-and-control: Context Free Grammar language model; for dictation: a statistical trigram language model."* Multi-pass search procedure … *SPHINX-II requires extraordinary working memory and high-end working station* – currently requirements for low-cost PCs. Always some speakers have a different *dialect, accent, culture background, or vocal tract shape*, but Sphinx-II lacks online adaptation and noise rejection mechanism (phone ring, cough and out-of-vocabulary words OOV). For a 20000-word dictation system, on average more than 3% of the words in a free-style test set are not covered by the dictionary; for vocabulary of 64,000 words, OOV > 1.5%. Error rate 20K words > 9% (excluding OOV*. The Nov 1992 ARPA stress test evaluation: both spontaneous speech with many OOV words & several different microphones*: *with > 20000 utterances in the training set and a noise normalization component, reduction only from 12.8→12.8% and 18% for the stress test*.
Sphinx-II: a lof of memory for the acoustic model. **Whisper**: 20 times less RAM, 5 x faster. … Uncompressed acoustic output probabilities: Codeword 1, Senone 1: 0.02; 0.28; 0.035; 0.0 … Codeword 256: 0.0 ; Senone 2: .02, 0.3 … Senone 3: 0.0, 0.0, 0.035 Senone 4: 0.0 … Senone 5: 0.1 Senone 6: 0.0. The sum of each column = 1.0 (senone-dependent output probability distribution); RLE compression for rows (run-length encoding, repetitive values = value & number of repetitions): Codeword 1 = <0.020,3>, 0.0, 0.1, ..., 0.0, Codeword 2 = 0.28, 0.30, 0.020, <0.0,257> … loseless compression > 35%; context-free grammar (CFG), non-terminals to terminals; disallow left recursion … Working size memory: 800 KB; **Noise rejection,** *the whole utterance, and then classifies each component as "accepted", "need clarification through dialogue" or "rejected" for the purposes of the user interface. Confidence measures, rejection accuracy … environmental & speaker adaptation … correction vector … Guassian distribution for noise & speech; adaptation rate … error rate: 1.8%.* ***Conclusion: The emergence of advanced speech interface is a significant event that will change today's dominating GUI-based computing paradigm****. It is obvious that the paradigm shift would require not only accurate speech recognition, but also integrated natural language understanding with a new programming model. The speech interface would not be considered intelligent until we make it transparent, natural, and easy to use. With our ongoing research effort, we believe that we could*

make Whisper engine work indeed as its acronym promised—Windows Highly Intelligent Speech Recognition."

*** Todor, 5.2.2025:** *1. **"a model for languages (sequences of words)" –** This definition is an example of the reduced, "crippled" conception of language as "sequence of words". Real thoughts have deeper and more complex representations and the linear *textual* or *vocal* sequence is only an input-output limitation of the physical body, time, cognitive performance trade-offs . LLMs emulate the existence of multiple possible trajectories with Tree-of-thought, ReAct, Reasoning etc. techniques, for sampling multiple generation paths, estimating consistency, matching final results etc.
*2. ***"the later symbols in a context are more important in predicting the subsequent symbol" –*** The later symbols in a context are *not always* more important in predicting the next symbol – the real languages and real texts are not just probabilistic sequences of symbols, they have meanings which may have different nature, one of which to refer to other sources of meaning or directions, to recall other "engines", to invoke etc. as it naturally continues in the LLM world with "tool use", "solvers", "web access", robot conrol etc. Note that sometimes *the most distant symbol*, word etc. could be *the most predictive* in comparison to the rest, e.g. the *title* or the name of a character in a story before a conclusion, which addresses it; also the most precise prediction is a result of the estimation of the whole sequences and also of a choice of proper interpreation and all map to other representations, virutal universes, simulations etc. and still the predictions can be approximate or a set of *possibilities*, as the text, especially the interesting and original one doesn't answer everything in an obvious and explicit way. There are different precisions of prediction, the average prediction precision at symbol level as characters or lowest level tokens between words or sentences etc. is with a bigger uncertainty than amids some stereotypical sequences etc. These are statistical quantities over many attempts.
Note that the actual "observed data" by the evaluator-observer is more than the literal

symbols – their implications, connections, associations etc. are also activated and considered. The hidden states of the deep and big LLMs encompass and encode some of these in an implicit form.

*** An Introduction to Least Commitment Planning Daniel S. Weld, 1994**
world description, goal, and domain theory**;** search with progression and regression forward or backward planners – from initial states or from the goal; coherent planning vs situated (deliberative vs non-deliberative, reactive); plan space or state space; branching in all positions, not only the end or the beginning of the plan; … selection of goal, action, … partial order (POP – partial order planning); causal links – provide preconditions for other actions; threats (changes which alter the state and the plan – invalidate causal links and require resolution with promotion or demotion – reordering of actionss, or confrontation); static & dynamic universes; least-commitment planning: avoid premature commitments, deferred decisions; STRIPS: propositions, conjunctive goals and add/delete lists; subgoal interactions (Sussman anomaly, A,B,C blocks, order of actions). Planning in planning space: nodes are plans, edges are refinements of the plans *(TA: cmp. PPO, proximal policy optimizations)*. Preconditions and effects. Conditional effects: depend on preconditions. Universal quantification: for all preconditions. Threat resolution. Closed world assumption: assuming false for unmentioned literals (cmp. the frame problem). Agenda: list of open preconditions to address. Unification: matching variables to bind parameters. Static or Dynamic universe – the latter allows creation and destruction of objects. Confrontation: resolve threats by negation problematic items. Heuristic search: domain knowledge helps guiding the planner. Maintenance goals – constraints which must hold through the execution but may

not stated explicily (e.g. preserve the environment and the agent self etc.). Hierarchical planning, case-based planning vs generative planning: use older plans or generate new from scratch; explanation-based planning – expirience improves efficiency. Branching factor – search efficiency. Systematic exploration: no redundant plan exploration. Soundness and completeness of planners. Plan verification; Null plan – the initial plan <Astart, Aend> with start/end actions - the planning process "grows" from thems. Means-end Analysis … Atomic planning, deterministic effects, omniscience, sole cause of change (only agent's actions); Total Order Planning vs Partial Order planning : <A; O; L> Actions, ordering constraints and causal links; nondeterministic "choose" primitive: number of calls to solution, number of possibilities to consider – branching factor

* **Is Programming by Example solved by LLMs?,** Wen-Ding Li, Kevin Ellis, 6.2024/19.11.2024 https://arxiv.org/pdf/2406.08316 PBE: Given input-output examples of a hidden algorithm, they seek to construct the source code of the underlying function; algorithms on vectors of numbers, string manipulation macros, and graphics programs in LOGO/Turtle. Pick a program ρ from {ρ ∈ L : ρ(Xi) = ρ(Yi), ∀i}. Succeed if ρ(X′j) = ρ(Y′j), ∀j (1) … FlashFill's. Basic prompting: List functions is a PBE domain meant to model a "programmer's assistant". *Classic PBE: Traditional approaches to programming-by-examples operate by symbolically searching or solving for programs consistent with the input-output examples [13, 49, 2, 1, 37, 6]. They use domain-specific programming languages that are designed to either enable efficient search and/or bias the system toward functions that are likely to generalize new inputs. Related Work: Automatic data generation with LLMs, such as self-instruct [32], WizardCoder … Collectively these results suggest that LLMs make strong progress toward solving the typical suite of PBE tasks, potentially increasing the flexibility and applicability of PBE systems.*

*** Code Repair with LLMs gives an Exploration-Exploitation Tradeoff**, Hao Tang Cornell, Keya Hu … Kevin Ellis (7), Cornell University, Shanghai Jiao Tong University,

29.10.2024 – refinement, explore-exploit tradeoff: n arm-acquiring bandit problem, Thompson Sampling, loop invariant synthesis, visual reasoning puzzles, and competition programming problems. Correct, repair, or debug its initial outputs; a tree of possible programs; branching factor is infinite; transition function is stochastic; "rollouts" would demand a prohibitively expensive series of LLM calls to refine down to some maximum depth. REx (REfine, Explore, Exploit); a multiarmed bandit framing: different actions correspond to refining different programs; reward corresponds to the quality of a newly generated program; and maximizing discounted future reward corresponds to solving the programming problem in the minimum number of LLM calls.
Bandit problems [multi-armed bandit: maximize the reward of a set of possible actions] Thompson Sampling - a probabilistic method for solving bandit problems, updates beliefs (prior/posterior) about each arm's reward distribution, Bayes rule; at each tep samples the beliefs and pulls the arm with the highest expected reward. Loop Invariant Synthesis: formal verificatio;, automatically find invariant conditions, which are always true during a loop execution. Z3 theorem: check invariants against three criteria: precondition, induction (invariant holds after each iteration) and postcondition. Solver. … Tasks: ***Bandits and Tree Search.*** *[classic] tree search algorithms introduce an explore-exploit tradeoff; Monte Carlo Tree Search (MCTS) is the canonical tree search algorithm that relies on this insight.* However REx has a different structure: no *rollouts, backups, or tree traversals. Instead: … the refinement process* [in the LLMs]*: any node can be further expanded (infinitely), every node can be treated as a terminal node, and node expansions are very expensive (so rollouts would not be practical). To the best of our knowledge, it is not possible to apply MCTS or any of its standard variants [35, 36, 37] to our problem statement out-of-the-box because of these unique properties. Bandit-based algorithms have also been applied for fuzz testing [38, 39], where code coverage is more important and code mutation is performed instead of code refinement ….*
Competition programming APPS dataset. visual reasoning puzzle (ARC, Chollet) … ***Limitations and Future Directions****: only modestly more effective at actually solving more problems overall in the large-compute limit: Its advantages are largest when viewed through the lens of minimizing cost, and of being robust across hyperparameters and datasets.*

Grammatical_evolution
Genetic_representation
Genetic_operator
Evolutionary_pressure
Genetic_drift – founder effect ..
Genetic_code
Meme | Memetic_algorithm
Cultural_algorithm – Belief spaces (knowledge): Normative (desirable value ranges for the individuals; acceptable behavior in the population), Domain specific (related to the area of application and the problem), Situational (events, successful and unsuccessful solutions), temporal (history of the search space – temporal patterns of the search process), Spatial knowledge – the topography of the search space
Fitness_function – objective or cost function that is used to summarize, as a single figure of merit, how close a given candidate solution is to achieving the set aims. .. In Evolutionary algorithms (EAs): each candidate solution, also called an *individual* is commonly represented as a string of numbers ("chromosome"). … niche differentiation, co-evolvng, fitness landscape … weighted sum, penalty functions. Pareto optimization – *Pareto-optimal if the improvement of one objective is only possible with a deterioration of at least one other objective.* Pareto set of objectives (f1, f2, …) to be maximized, constraints. Objectives: Primary objectives, Auxiliary objectives.
Loss_function |
Test_functions_for_optimization
https://en.wikipedia.org/wiki/Fitness_landscape or adaptive landscape: the relationship(genotypes, reproductive success). *Fitness: Height of the landscape. Similar genotypes – close to each other, different – far from each other.*
Inferential_programming - *describing an intended result to a computer, using a metaphor such as a fitness function, a test*

lgorithm#Practical_optimizations_and_infinite_graphs | Bidirectional_search
Genetic_programming | Meta-genetic programming |
Genetic_improvement_(computer_science) | Search-based_software_engineering |
Metaheuristic – *a higher-level procedure or heuristic designed to find, generate, tune, or select a heuristic (partial search algorithm) that may provide a sufficiently good solution to an optimization problem or a machine learning problem, especially with incomplete or imperfect information or limited computation capacity* .

Glover, F.; Kochenberger, G.A. (2003). Handbook of metaheuristics. Vol. 57. Springer, International Series in Operations Research & Management Science. ISBN 978-1-4020-7263-5.
Blum, Christian; Roli, Andrea (2003). „Metaheuristics in combinatorial optimization: Overview and conceptual comparison“. *ACM Computing Surveys*. **35** (3). ACM: 268–308. doi:10.1145/937503.937505

Matheuristics – *problem agnostic optimization algorithms that make use of mathematical programming (MP) techniques in order to obtain heuristic solutions. Problem-dependent elements are included only within the lower-level mathematic programming, local search or constructive components.*
Rider_optimization_algorithm – *ROA, attacker, overtaker, follower, and bypass rider.*
* Binu D and Kariyappa BS (2019). „RideNN: A new rider optimization algorithm based neural network for fault diagnosis of analog circuits“.
Local_search_(optimization) – problems that can be formulated as finding a solution that maximizes a criterion among a number *specification, or a logical specification, and then the computer, on its own, would construct a program needed to meet the supplied criteria.*

Population_model_(evolutionary_algorithm) – the set of all proposed solutions in an EA in one iteration – individuals. Island models – subpopulations, size, neighbourhoods, criteria for the termination of an epoch; sync or async migration, migraion rate, migrant selection. Neighbourhood models – diffusion model or fine grained model, topological relations. Locality – isolation by distance. Cellular Eas, cellular genetic alg. cGA. *A commonly used structure for arranging the individuals of a population is a 2D toroidal grid*
https://en.wikipedia.org/wiki/Panmixia - global or panmixic model, panmicticism – uniform random fertilization; ***random mating*** *usually implies the hybridising (mating) of individuals regardless of any spatial, physical, genetical, temporal or social preference. … individuals are able to move about freely within their habitat, possibly over a range of hundreds to thousands of miles, and thus breed with other members of the population.*
Differential_evolution
Gaussian_adaptation – normal or natural adaptation (in GA – mean fitness); climbing a mountain example : with a normalization using a Gaussian function around the current location
Coevolution – mutualism
* Mathematical_optimization …
Global_optimization; branch and bound methods (BB, B&B) – discrete & combinatorial optimization problems: systematic enumeration of candidate solutions by menas of state space search … rooted tree … interval methods .. cutting-plane methods …

of candidate solutions. | https://en.wikipedia.org/wiki/Feasible_region#Candidate_solution Iterated_local_search - a modification of local search or hill climbing; "kicking" a solution out from a local optimum; perturbation algorithm, (adaptive,optimizing) perturbation. *A simple modification: iterating calls to the local search routine, each time starting from a different initial configuration – repeated local search.* Variable_neighborhood_search – VNS, more distant neighborhoods of the current incumbent solution … neighborhood change: descent to local minima and escape from valleys containing local minima. Guided_local_search – a meta-heuristics; builds up penalties during a search; Selective penalty modifications; searching through an augmented cost function .. Tung-leng Lau – *guided genetic programming (GGA) algorithm. It was successfully applied to the general assignment problem (in scheduling), processors configuration problem (in electronic design) and a set of radio-link frequency assignment problems (an abstracted military application).* * Davenport A., Tsang E.P.K., Kangmin Zhu & C J Wang, GENET: A connectionist architecture for solving constraint satisfaction problems by iterative improvement, Proc., AAAI, 1994, p. 325-330 Greedy_randomized_adaptive_search_procedure Greedy randomized adaptive search procedure (GRASP): restricted candidate list (RCL). Semi-greedy heuristic, … cost perturbations, bias functions, memorization and learning, and local search on partially constructed solutions… *Phase I: the constructive phase, a feasible solution for the entire problem is constructed in a stepwise manner.* Then it is used for the local improvement Phase II. Gradient_descent – multi-variable	Schema_(genetic_algorithms) – a subset of strings with similarities at certain string positions, a template |* Formal_concept_analysis – deriving a *concept hierarchy* or formal ontology from a collection of objects and their properties. .. context's „concept lattice". "Restructuring Lattice Theory",Rudolf Wille, 1982. "Bodies of water" … Software: ConExp[19], ToscanaJ[20], Lattice Miner[21], Coron[22], FcaBedrock[23], GALACTIC[24] .. Biclustering and multidimensional clustering, knowledge spaces Fitness_(biology) - **reproductive success (Tosh: NB!: not just "adaptability" etc.;** *average contribution to the gene pool of the next generation, made by the same individuals of the specified genotype or phenotype. The fitness of a genotype is manifested through its phenotype. … Herbert Spencer's well-known phrase "survival of the fittest" should be interpreted as: "Survival of the form (phenotypic or genotypic) that will leave the most copies of itself in successive generations."* **Tosh:** i.e. in human populations, currently the people which live about the worst, the poor nations in Africa, who reproduce the most, are "the most fitted" in biological sense by these definitions and their genes survive better [27.4.2025]. Propensity_probability – disposition, tendency … to yield a certain kind of outcome; purported causes, not relative frequencies. * Universal_Darwinism – ***@Vsy: ObObr:*** beyond biology, but also in psychology, linguistics, economics, culture, medicine, computer science, and physics etc.: *variation, selection, heredity or retention* … searching for the best solution of how to survive and reproduce by **generating new trials, testing how well they perform, eliminating the**

function , defined and differentiable in a neighborhood of a point a, then F(x) decreases *fastest* if one goes from a in the direction of the negative gradient of F … small enough step size or learning rate … Constructive_cooperative_coevolution - multi-start architecture of GRASP; decomposition into subproblems; simulation-based optimisation. Hill_climbing – ridge, alley; plateau, local maxima; Hyper-heuristic – search in the space of heuristics; heuristics to generate heuristics: HyFlex, ParHyFlex, EvoHyp, MatHH. http://titancs.ukzn.ac.za/EvoHyp.aspx Multi-objective_optimization – multi-objective programming, vector optimization, multicriteria optimization, or multiattribute optimization, Pareto optimization; multiple-criteria decision making .. trade-offs – two or more conflicting objectives. *A solution is called nondominated, Pareto optimal, Pareto efficient or noninferior, if none of the objective functions can be improved in value without degrading some of the other objective values.* Bicriteria optimization, multitask optimization. Multiple-criteria_decision_analysis (MCDA, or MCDM – MCD making) multiple attribute utility theory, multiple attribute value theory, multiple attribute preference theory, and multi-objective decision analysis. Analytic_hierarchy_process - *a structured technique for organizing and analyzing complex decisions, based on mathematics and psychology.* Choice, ranking, prioritization, resource allocation, benchmarking, quality managemnt, conflict resolution … Planning, priority setting, selection among alternatives; forecasting, total quality management, business process reengineering, quality function deployment, balanced scorecard.	**failures, and retaining the successes.** *"organism" is replaced by any recognizable pattern, phenomenon, or system. … variation and selection, and thus adaptation of: genes, ideas (memes), theories, technologies, neurons and their connections, words, computer programs, firms, antibodies, institutions, law and judicial systems, quantum states and even whole universes. …* * Inclusive_fitness (expected fitness resturns: direct/indirect) Content-addressable_memory (Associative memory); Data word recognition unit - Dudley Allen Buck, 1955. https://en.wikipedia.org/wiki/Multi-task_learning exploiting commonalities and differences across tasks. inductive transfer Transfer_learning Domain_adaptation … Fitness_proportionate_selection Evolutionary_algorithm → *1. Randomly generate the initial population of individuals, the first generation. 2. Evaluate the fitness of each individual in the population. 3. Check, if the goal is reached and the algorithm can be terminated. 4. Select individuals as parents, preferably of higher fitness. 5. Produce offspring with optional crossover (mimicking reproduction). 6. Apply mutation operations on the offspring. 7. Select individuals preferably of lower fitness for replacement with new individuals (mimicking natural selection).* *Return to 2.* ***Tosh:** It doesn't have to be randomly. For complex, hierarchical and yet-unknown future orgainsms/targets* the current higher fitness is not strictly better – different selection criteria. 28.4.2025 Evolutionary_programming – mutation without crossover. All individuals are

https://en.wikipedia.org/wiki/Analytic_hierarchy_process_%E2%80%93_car_example : Choose the best car: cost – purchase price, fuel costs, maintenance costs, resale value, safety, style, capacity – cargo, passenger … 6 cars: Accord Sedan, Accord Hybrid, … Pairwise comparing the criteria with respect to the goal … Imntensity of importance (1 = equal, 3 = moderate, 5 = strong, 7 = very strong, 9 = extreme) quotient: total = 1.0. (E.g. cost = 0.5m safety = 0.25, style = 0.05, capacity = 0.2) → then subdivide 1.0 for the subcategories (e.g. Cost: 0.25 purchase price, 0.5 fuel cost, 0.25 maintenance cost, 0.1 resale value 0.15) etc. Analytic_network_process Quality_function_deployment – *Japan 1966, customer desires: WHATs, importance, engineering characteristics which may be relevant (HOWs), correlates the two, allows for verification of those correlations, and then assigns objectives and priorities for the system requirements… any system composition level (e.g. system, subsystem, or component) in the design of a product, and can allow for assessment of different abstractions of a system* Balanced_scorecard - management; a strategy performance management tool; strategic agenda, monitor performance against objectives; mix of financial and non-financial data items (perspectives): financial, customer, internal process, learning & growth; a portfolio of initiatives designed to impact performance of the measures/objectives. Strategy_map - the strategic goals being pursued by an organization or management team. Min 32x32, below that the recognition drops for humans (see Tiny Images paper, 2008)
p.4: iGPT-XL,L = 60 layers, embedding size of d = 3072 for a total of 6.8B parameters. iGPT-L, is ~ identical to GPT-2 with L = 48 layers, but a smaller embedding size of d = 1536 (vs 1600) = 1.4B parameters. The same model code as GPT-2, except that the weights are initialized in the layer dependent fashion as in Sparse Transformer (Child et al., 2019) and zero-initialize all projections producing logits. iGPT-M: 455M, L = 36 and d = 1024. iGPT-S, a 76M parameter model, L = 24 d = 512 to study the effect of model capacity on representation quality in a generative model. **Training iGPT-XL**: a batch size of 64, 2M iterations. For all other models: batch=128, 1M it. Adam with β1 = 0.9 and β2 = 0.95 and sequentially try the learning rates 0.01, 0.003, 0.001, 0.0003, ..
*"**Towards general unsupervised learning:** Generative sequence modeling is a universal unsupervised learning algorithm: since all data types can be represented as sequences of bytes, a transformer can be directly applied to any data type without additional engineering."* **Tosh:** Compare with the Bulgarian Predictions 2001-2004 from "Theory of Universe and Mind". by Todor Arnaudov, The Sacred Computer.
"Because we use the generic sequence transformer used for GPT-2 in language, our method requires large amounts of compute: iGPT-L was trained for roughly 2500 V100-days while a similarly performing MoCo24 model can be trained in roughly 70 V100-days. Relatedly, we model low resolution inputs using a transformer, while most self-supervised results use convolutional-based encoders which can easily consume inputs at high resolution. A new architecture, such as a domain-agnostic multiscale transformer, might be needed to scale further. "
* Torralba, A., Fergus, R., and Freeman, W. T. **80 million tiny images: A large data set for nonparametric object and scene recognition**. IEEE transactions on pattern analysis and machine intelligence, 30(11):1958–1970, 2008.

For unconditional image synthesis or unsupervised learning, we pretrain a decoder-only Transformer model to predict the next token. For class-conditioned image synthesis, a class-id token is prepended before the image tokens. To evaluate the quality of unsupervised learning, we average the intermediate Transformer features and learn a linear head to predict the logit of the classes (a.k.a., linear-probe). .. a better image quantizer with respect to both computational efficiency and reconstruction quality. An efficient quantizer can speed up Stage 2 training, where random augmentations are applied first to an image, followed by the encoder of image quantizer to obtain the input tokens. Moreover, an image quantizer with better reconstruction quality can reduce information loss compared with the original image in pixel space, which is critical for image understanding tasks***. Improvements:*** Vailla VQVAE: low codebook usage, poor initialization, many codes are rarely used or not used at all. VQGAN: topk & top-p nucleus sampling heuristics, default codebook size of 1024. .. **Factorized codes:** *a linear projection from the output of the encoder to a lowdimensional latent variable space for code index lookup (e.g., reduced from a 768-d vector to a 32-d or 8-d vector per code) and find it has an immediate boost of codebook usage.* ***l2-normalized codes. …*** *factorized codes with low-dimensional latent variables consistently achieve better reconstruction quality when the latent dimension is reduced from 256 to 16 or 8*

*** Scaling Autoregressive Models for Content-Rich Text-to-Image Generation**
Jiahui Yu, Yuanzhong Xu et al., 22.6.2022, Google Research, https://github.com/google-research/parti Pathways Autoregressive Text-to-Image model (Parti)*; 1) a transformer-based image tokenizer, ViT-VQGAN, to encode images as sequences of discrete tokens. 2) consistent quality improvements by scaling the encoder-decoder Transformer model up to 20B https://sites.research.google/parti/*

* **Retina Vision Transformer (RetinaViT): Introducing Scaled Patches into Vision Transformers**, Yuyang Shu, Michael E. Bain, University of New South Wales, 20.3.2024 https://arxiv.org/html/2403.13677v1 +3.3% performance cmp the original ViT; low spatial frequency components – capture, select and forward structural and important features to deeper layers. Biologically-isnpired, … a stride of half the patch size (8); image pyramid; *Intuitively, blobs of a similar colour or texture, or areas enclosed by a contour, could*

constitute basic units in vision. But irrespective of the precise definition, the size and shape of such basic units could vary considerably. By including patches of the same image at different scales, RetinaViT has a higher chance of capturing a semantically meaningful basic unit in its input. .. RetinaViT is closer to CNN than ViT, because its input contains the same image at multiple different scales .. stronger than both CNN and ViT in recognizing scale-invariant features, and has a higher chance of detecting the same objects at various scales.

Continuing fine-tuning models on new tasks, with the goal of „transferring“ relevant knowledge from past tasks; risk negative transfer. A new benchmark of task sequences that target different possible transfer scenarios: *high potential of positive transfer, high potential for negative transfer, no expected effect, or a mixture of each. An ideal learner should be able to maximally exploit information from all tasks that have any potential for positive transfer, while also avoiding the negative effects of any distracting tasks that may confuse it.* Forward transfer – *faster "rate of learning" on a new task***;** the relations between consequent tasks; exploit information for previous tasks with potential for positive transfer (checkpoints) … intermediate fine-tuning – auxiliary task before the target task; others: parameter-efficient forward transfer & resistance to catastrophic forgetting; this work: training efficiency on the new task (not the performance on previous tasks); p.5 collection of tasks: Summarization : AESLC, AG News, CNN-DM, Gigaword, Multi-News, NewsRoom ,SamSum, WikiLingua EN, Xsum…, structure to text: CommonGen, DART, E2ENLG, WEBNLG, Paraphrase: MRPC, QQP, PAWS, STS-B, Sentiment, Coreference, Word disambiguation, Math, Reading comprehension with commonsense, Entailment, Reading Comprehension, Commonsense, Open-domain QA, Text formating, Linguistic acceptability, Qeustion classification (TREC), Conversational QA … Pair of tasks; … learning a checkpoint selector – set of previously solved tasks {t1, …, tn} – *select a previously fine-tuned model on some task ti to initialize from … selective sequential finetuning*

*** Real or Fake? Learning to Discriminate Machine from Human Generated Text**
Anton Bakhtin, Sam Gross, Myle Ott, Yuntian Deng, Marc'Aurelio Ranzato, Arthur Szlam 6.2019/11.2019 https://arxiv.org/abs/1906.03351
Energy-based models (EBM) - un-normalized models; the joint compatibility between all input variables, unlike the auto-regressive models which are a sequence of conditional distributions; E(w1, w2, …, wn|c;θ) - joint compatibility of an input sequence of tokens, c – context, θ – params;c can vary: either preceding text, keywords, bag of words, a title etc. losses: binary cross-entropy or ranking; the

method to generate negatives is critical (high energy score = unlikely inputs) – auto-regressive models Final*: EBM framework could potentially unlock more expressive models of text, as they are not limited to scoring a single word at a time as current locally normalized auto-regressive models do.*
See also Yann LeCun, JEPA etc. as cited in "The Prophets of the Thinking Mahines …" and the originals: **I-JEPA: The first AI model based on Yann LeCun's vision for more human-like AI**, 13.6.2023 https://ai.meta.com/blog/yann-lecun-ai-model-i-jepa/

TA, 23.1.2025: As a definite decision in a fully general case, this is an ill-defined task; the goal could be detecting "fake news" etc. A competent (or incompetent) text could be impossible to distinguish by definition either for "universal" case, if it is short enough or if you don't have a full dataset or laws for "really human" "real" texts, and be sure that humans definitely don't write like the style now assigned to LLMs (they know that "this is fake"), and you have confident expectations about the writer's competences. It could work when there are clearly defined boundaries and stereotypes, as in particular fixed datasets. This is a 2019 work before ChatGPT and the GPT2 etc. from the time still could have their easy to spot mistakes and peculiarities, especially if the context increases, however they sometimes repeat the originals as they have to be plausible, and answers and styles of the instruction LLMs which were stereotypical say in 2023-2024 for models with particular sizes, are also result of the respective fine-tuning datasets, which are prepared by humans, which intended to "paint" a particular style of the answers, greetings etc., it's both or all "real" and "fake" and intended to "look like real". After the release of ChatGPT 3.5 and GPT4 and other powerful models, they started to be used to generate datasets for fine-tuning etc.
