ПРОРОЦИТЕ НА МИСЛЕЩИТЕ МАШИНИ

Изкуствен разум и развитие на човека:
История, теория и пионери
Минало настояще и бъдеще

Тодор Арнаудов – Тош

ПРИЛОЖЕНИЕ АНЕЛИЯ

Преглед и бележки по научни работи от и с участието на Анелия Ангелова, Пламен Ангелов, Никола Касабов, Димитър Филев, Александър Тошев, Любомир Бурдев, Мира Дончева, Драгомир Ангелов, Драгомир Радев, Кристина Тутанова, Руслан Митков, Зорница Козарева, Преслав Наков, Галя Ангелова, Кирил Симов, Ани Ненкова, Тодор Михайлов, Веселин Стоянов, Веселин Райчев, Мартин Вечев, Светослав Караиванов; Красимир Атанасов, Стоян Михов, Петя Копринкова-Христова, Виргиния Савова; Васил Сгурев, Димитър Добрев и други от България и света по информатика, изкуствен интелект, машинно обучение; компютърно зрение, компютърна графика и обработка на изображения; компютърна лингвистика и обработка на естествен език; езици за програмиране, синтез на програми, автоматично програмиране и др. Обзор на друга свързана стара и съвременна литература от тези области.

и **Тодор Арнаудов** – автор на *„Пророците на мислещите машини“* и редактор: откриване, преглед и подбор на учени и публикациите им; проучване, обобщение и извадки на най-важни откъси и понятия; бележки и разяснения по статиите и темите и допълнителни обзори от миналото и настоящето; автор на някои от цитираните разработки и проекти: „Smarty“, GPT2-Medium-BG, Вседържец; цитиран откъс от *„Първата модерна стратегия за развитие с изкуствен интелект …“*

Други споменати български изследователи: Антон Александров (INSAIT, BgGPT), Петко Георгиев, Илиян Заров, Румен Данговски (Petko Georgiev (DeepMind), Roumen Dangovski, Iliyan Zarov (Meta AI: LLAMA); Васил Чаталбашев, Красимир Коларов и др. От ПУ: Георги Тотков, Христо Крушков, Христо Танев, Васил Василев, Александър Пенев и др.

СВЕЩЕНИЯТ СМЕТАЧ

МИСЛЕЩИ МАШИНИ, ТВОРЧЕСТВО И РАЗВИТИЕ НА ЧОВЕКА

Целогодишна виртуална конференция „Мислещи машини 2025“, или Self-Improving General Intelligence 2025 – SIGI-2025. Продължение на може би втората най-стара международна „конференция“ за универсален изкуствен разум (AGI): SIGI-2012-1, провела се присъствено в Пловдив през 2012 г.

THE SACRED COMPUTER

THINKING MACHINES, CREATIVITY AND HUMAN DEVELOPMENT

Thinking Machines 2025/Self-Improving General Intelligence SIGI-2025:
a yearlong virtual conference, continuing SIGI 2012-1.

Обзори на някои тематични раздели освен конкретни български учени

* Компютърно зрение и обработка на изображения в различни приложения: самоуправляващи се превозни средства, разпознаване на образи и класификация и др.
* Машинно обучение, изкуствени невронни мрежи
* #Vision Tasks #Vision-Language Tasks #Зрителни задачи Изброяване на задачи от компютърното зрение
* Други статии по съвременно разделяне на изображения свързани с работи на Анелия Ангелова и Александър Тошев; Мира Дончева и др. – Current Image Segmentation #segmentation
* Невроморфни системи, импулсни невронни мрежи: Никола Касабов, Пламен Ангелов
* Размита логика – Димитър Филев, Н.Касабов, П.Ангелов и др.
* Класически трудове по разрешаване на многозначност чрез използване на контекста и корпуси – Word Sense Disambiguation WSD, Context, Corpus Linguistics
* Ранна работа в статистическата езикова обработка, корпусна лингвистика, извличане на данни, групиране и др. над големи обеми от данни и Интернет – Драгомир Радев; Зорница Козарева и др.
* Компюърна лингвистика и обработка на естествен език със статистически методи и машинно обучение – Кристина Тутанова, Зорница Козарева, Драгомир Радев и др.
* Първопроходна работа на Руслан Митков и школата му в компютърната лингвистика – разрешаване на анафори, подпомагане на превода чрез лексикология/лексикография и преводна памет.
* Школата на ПУ Паисий Хилендарски в Компютърната лингвистика от края на 1980-те и 1990-те и след това – морфологичен анализ и други видове разбор и моделиране на българския език, лексикология и лексикография, машинно обучение и автоматично разделяне на групи, извличане на информация и др. – Георги Тотков, Христо Крушков, Христо Танев, Зорница Козарева, Атанас Чанев; Тодор Арнаудов и др.
* Бележки към конференцията по Компютърна лингвистика CLIB 2024 в София: Веселин Стоянов, … и др.
* Мултимодални пораждащи модели #multimodal #мултимодални
* Programming languages, program synthesis & verification, compilers and code optimization, formal verification, static analysis, interpreters, concurrency… #programlanguages #programsynthesis – Програмни езици, синтез на програми, верификация, оптимизация, интерпретатори и компилатори … – Веселин Райчев, Мартин Вечев, Светослав Караиванов; Васил Василев, Александър Пенев и др.
* БАН – група по невроморфни системи; история на ИИ в България и др. – П.Копринкова-Христова и др.; групи по крайни автомати и др. (С.Михайлов), обобщени мрежи – Красимир Атанасов; исторически: В.Сгурев, Д.Добрев и др.
* Бележки за ЕЕГ и за българския принос в техники за изчистване на шума при снемане на ЕКГ(EEG, ECG) – Чавдар Левков и др.
* И др.
* Виж за други българи в някои от тези и други области като роботиката, която е една от *„българските“* области подобно на компютърната лингвистика и в нея има няколко

пионера в епигенетичната роботика (роботика на развитието); философията и когнитивната наука, конекционистки системи, симулации за роботи, учене с подкрепление; други пионерни работи в България от ТУ София и др. в *основния том*; приложение *Лазар* и др.

(…)

Езици: български и английски | **The content** is in **English and Bulgarian**

Томове и приложения на *Пророците* ...

Съществуващи и някои възможни бъдещи томове

* **#prophets –** Основен том (>1859 стр., 13.8.2025); Обзор на Теория на Разума и Вселената, сравнение с работи в други школи, които преоткриват и повтарят, или пък предхождат обобщаването на принципите за създаване на общ изкуствен интелект, които бяха формулирани още в началото на 2000-те г. и постепенно се сбъднаха и се сбъдват. Документален преглед на огромен обем научни школи, литература и факти, кратка и подробна хронология ... #tosh1

* **#purvata – „**Първата модерна стратегия за развитие чрез ИИ е публикувана от 18-годишен българин през 2003 г. и повторена и изпълнена от целия свят 15-20 години по-късно: Българскиe пророчества: Как бих инвестирал един милион с най-голяма полза за развитието на страната?“ #tosh2 (31.5.2025, 248 стр.)

* **#listove –** Многообразие от теми сред които класическа и съвременна роботика и планиране, мулти-агентни системи – класически и съвременни с големи езикови модели; невронауки и невроморфни системи, съзнание и панпсихизъм, алгоритмична сложност, други теории на всичко и вселената сметач; когнитивна лингвистика и мислене по аналогия, езикови модели и машинно обучение – исторически и най-нови системи, мултимодални модели, основни модели за агенти и роботи; обзор на научни статии, новини, платформи на чатботове и други пораждащи модели за различни модалности и практика; съветска школа в изкуствения интелект и мн.др. (...) 414 стр. (13.8.2025 г.)

* **#mortal – Нужни ли са смъртни изчислителни системи за създаване на универсални мислещи машини?** „Смъртните“ системи са свързани с носителя си, за разлика от „безсмъртни“, за каквито се смятат „обикновените“ компютри. Но дали и невроморфните са наистина невроморфни, и какво точно е „безсмъртност“, „смъртност“, „самосъздаване“ (автопоеза) и дали въобще е възможна. Наистина ли са по-ефективни невроморфните системи, както и живите или по-модерните електронни технологии с по-малки транзистори, или ефективността е избор на „счетоводство“ и скриване на реалните разходи за създаването и съществуването на съответната технология? (...) 70 стр.

* **#universe6 #UnM6 –** Вселена и Разум 6 – #tosh3; съзанание, „метафизика“, „умоплащение“ ... на английски; свързана с теми от #mortal (...)
* **Universe and Mind 6** – Connected to “Is Mortal Computation...” – in English.

* **#sf #cyber –** Научна фантастика за ИИ, Футурология, Кибернетика ... Подробен преглед и сравнение на статия на Майкъл Левин от 2024 г. за самоимпровизиращата се памет с идеи от Теория на Разума и Вселената.

* **#irina –** Беседи и подробни бележки и др. статии; Ирина Риш; вижданията на Йоша Бах и др. и съвпаденията на идеите му с Теория на Разума и Вселената, публикувана 20 години преди коментираните дискусии; интервю с Питър Вос на ръба преди „ерата“ на ентусиазма към Общия ИИ през 2013 г.; сбъднали се предвиждания от 2005 г. за машинния превод и творчеството и за автоматичното програмиране от 2018 г. и др.; беседа с участието на Майкъл Левин (повече от него в #Основния том, #Кибернетика и #Листове.

* **#lazar #lotsofpapers –** Работата на някои български и мн. др. учени, около зората на напредъка на обучението на дълбоки невронни мрежи; автоматичен синтез на програми, компютърно зрение от миналото и настоящето, големи езикови модели, ...

* **#anelia –** Този том с преглед работата на много български учени и др.

* **#instituti**– преглед на институти по ИИ в Източна Европа и света, сравнение на повтарящите се послания; към 2003 г. в България имаше публикувани **2 национални стратегии** за развитие с ИИ - 16 години преди първата чернова на БАН и 19 години преди откриването на INSAIT, и двете дело на Юноши.

* **#complexity** – Алгоритмична сложност – обзор и бележки по множество статии и обобщения и изводи. Дали машината на Тюринг е подходяща за описание на *Мислеща машина?* #hector

* **#calculusofart** – Математически анализ на изкуството. Музика I – Как се определя дали даден „къс“ изкуство е красиво и защо ни харесва? Красотата, компресирането и предвиждането на бъдещите данни въз основа на миналите. Музиката трябва да е красива и да се измерва във всички мащаби, от най-малките с постепенно нарастващ обхват.

* **#kotkata –** Задачата от *„Анализ на смисъла на изречение въз основа на базата знания на действаща мислеща машина (...)“,* Т.Арнаудов 2004 г. в диалог с чатботовете ChatGPT и Bard, края на 2023 г. до нач. на 2024 г. и с GPT5 пред 2025 г., който успява да разбере и приложи в опростен вид

метода от статията

* **#zabluda –** Заблуждаващите понятия и разбор на истинския им смисъл: трансхуманизъм, цивилизация, ... – книга, която публикувах през 2020 г. и започна като статия за трансхуманизма. Откъсът може да бъде включен и в отделно приложение.

#razvitie #transhumanism – том фокусиран върху развитието на човека, космизъм, „трансхуманизъм“; етика, биотехнологии, мозъчно-компютърен / мозъчно-машинен взаимлик (Brain-Computer Interface, Brain-Machine Interface), невроморфни системи, генетично инженерство, геномика, биология, симулиране на клетки и живи организми и др.

Практика, работилници и др. (бъдещи)

* **#robots-drones-ros-slam-simulation-rl** – Наземни и летящи роботи: дронове; обща теория, практика, конкретни системи и приложения; Robot Operating System (ROS, ROS2); среди за симулации на физически и виртуални роботи и машинно обучение: Gazebo, MuJoCo, RoboTHOR, Isaac Sim, Omniverse; gymnasium и др.

* **#neuromorphic-snn-practice** – Практика по невроморфни системи, импулсни невронни мрежи; Lava-nc и др.

* **#llm-generative-agents** – големи езикови модели: локална работа, платформи; употреба, подготвяне на набори от данни; обучение, тестване. Текст, образ, видео, триизмерни модели, програмен код, цели игри и светове с физика („world modeling“), всякакви модалности; дифузни модели, преобразители (трансформатори), съгласувани с физиката математически модели, причинностни модели с управляващо-причиняващи устройства по идеите от Теория на Разума и Вселената. Агенти, мулти-агентни системи: архитектури и др ...
(виж ***Листове*** и ***Лазар****)*

* **#codegen –** автоматично програмиране, синтез на програми; модели за тази цел, платформи; методи, приложения ... program synthesis, automatic programming, code generation

* **#sigi-evolve –** саморазвиващи се машини, еволюционни техники,

рекурсивно самоусъвършенстване (Recursive Self-Improvement, RSI)

* **#appx – Приложение на приложенията**, списък с добавени по-късно; ръководство за четене и др.

* **#agi-chronicles** – хронологичен запис и проследяване на развитие на история, новини, събития, идеи, системи, приложения; изследователи *(вероятно с Вседържец)*

... следват продължения – други приложения и *Вселената*:

* **Създаване на мислещи машини** – ... Зрим, Вседържец , Вършерод, Казборocc, Всеборавител, Всетводейство, Всевод, (...)

Внимание! Този списък и информацията в него може да са непълни, неточни или остарели. Възможно е да излизат нови издания с поправки и допълнения. За обновления следете уеб страниците, фейсбук групата „Универсален изкуствен разум“, Ютюб каналите, Дискорд сървъра и др.

Можете да помогнете за подобрението на съществуващите и за осъществяването на бъдещите разработки.

Свещеният сметач призовава съюзници, съмишленици, съдружници и сътрудници; университети, изследователски институти и фирми; учени, инженери, разработчици и творци; спомоществователи, дарители, последователи, другари, изследователи и съавтори за продължения и подобрени версии и за развитие на дейността на изследователско-творческото дружество.

Ако искате да помогнете, за конкретни идеи вижте в началото на основния том, в приложение *Листове,* в информацията за проекта **Вседържец** или *се свържете с мен.*

Всякаква съвременна техника за *нова*[1] изследователска дейност би ни била от полза в работата, както и достъп до облачни услуги от всякакъв вид – от достъп до пораждащи модели като ChatGPT, Gemini, LangChain, до сървъри, дисково пространство и пр. Помещения за техника и работа също може да са полезни.

Съхраняването на българската и световна компютърна история и памет е част от дейността на *Сметача* още от зората му през 2000 г.

Стара българска и световна изчислителна техника, която искате да дарите, също е добре дошла при нас или например при компютърния музей *„Компу Пловдив“ (Compu Plovdiv),* на който сътрудничим.]

[1] Мислещата машина Вседържец работи на такава техника, с каквато разполагаме и се вмества в нея. Ако не можем да осигурим друго, Вседържец ще трябва да се справи и на едно или няколко PC-та, лаптопи и по-малки компютри, с възможна връзка и към мобилни устройства за сензори и други помощни обработки; без или със достъп до Интернет и облачни услуги, които също предоставят допълнителна мощ безплатно или на достъпна цена, дори и за сиромаси. Виж *„Сингулярност на Тош“ – уравнението на относителната ефективност* в приложение *„Първата модерна стратегия…“*

Приложение „Анелия“ е част от широк и дълбок преглед на работата на български и световни изследователи по изкуствен интелект и общо – всякакви науки за ума и познанието, и техните приложения.

За по-опитните читатели *„Анелия“* може да послужи за припомняне и задълбочаване, и за откриване и научаване на важни направления, теми, методи, понятия, разработки от миналото и настоящето чрез четене и проучване на конкретни научни публикации във времето и в работата на конкретните разглеждани учени, които са допринасяли за развитието на съответните области. Процесът е подпомогнат и ускорен чрез обобщенията и бележките за най-важното. Този том, макар и „недоподреден“ по обичайния начин, е вид алманах, енциклопедия, библиографски справочник и набор от данни с личности и основа за откриване и извличане на други свързани учени и теми чрез т.нар. изследване на литературата[2] – било „по-ръчно“ или чрез „по-автоматична“ обработка с търсещи машини и езикови модели – за построяване на допълнения и още връзки с материалите от другите части на *Пророците*: *Лазар, Листове, Основния том* … и др. и въобще в разглежданите области на познанието; за проследяване на преходите в развитието на определени научни понятия и задачи, напредъка в съответните научни области и подобласти и развитието на конкретни учени: и български, и световни.

Пророците въвежда любознателния читател в много области от науките и знанията за ума и мисленето, подобно на предобучението на мултимодален пораждащ модел, като в процеса се откриват и отбелязват връзки и съвпадения между далечни „места“ от рисуващата се карта, открива се повтарящото се или различно във времеви периоди, различни науки и научни школи; извличат се най-важните понятия и идеи и се достига до обобщения и заключения, въз основа на синтезирането на многообразно и широкообхватно знание.

Виж още уводните бележки към *Листове; Основният том;* текстовете за мултимодалните модели в *„Първата стратегия…“* и в споменатите два тома, *„Творчеството е подражание на ниво алгоритми“*, 2003 и *др.*

Бъдещите версии ще са част от или ще работят с мислещата машина ***Вседържец***, която ще ги направи взаимодействащи и по-удобни за изучаване, търсене, подреждане, допълване, изобразяване, свързване, превод, … *(…)*

Анелия Ангелова – Google, Google Deepmind, ...
https://scholar.google.com/citations?user=nkmDOPgAAAAJ&hl=en
Важни работи в приложения на машинното обучение, компютърното зрение, навигацията за самоуправляващи се превозни средства, големи езикови модели, роботика от началото на 2000-те години до днес.

* **Rapid object detection,** 5/2003, A.Angelova
https://citeseerx.ist.psu.edu/document?repid=rep1&typef=pdf&doi=2f7aea8299b39b78dba7f5c44e98c078cad928d0
https://www.researchgate.net/publication/248563069_Learning_for_Autonomous_Navigation_Extrapolating_from_Underfoot_to_the_Far_Field

Самоуправляващи се превозни средства за изследвания на Земята и в космоса. За NASA, DARPA. % zones: proprioceptive (1m), Near-field/Mid-field/Far-field (10m, 50m, infinity); learning from 3D geometry (Lf3D); learning from proprioception (LfP) - from images; traversability analysis, traversability cost on grid-based map cells; local map representations; learning: SVM, 2000 traversable/non-t. examples --> 784 support vector ... K-means clustering; ... Slipping +trav.cost; Mixture of Experts;

* **Angelova, A. N. (2004). Data pruning. MSc. Thesis**, California Institute of Technology https://thesis.library.caltech.edu/2184/1/DataPruning.pdf
Подобряване на обобщаващата сила на ученето след премахване на определени примери. Множество полунезависими класификатори, чрез които се разпознават нискокачествени образци, при които има повече разногласия. (Outliers, difficult examples); Надеждна статистика (Robust); решение какво да се прави с граничните случаи и шума? Да се премахнат, да се ограничи теглото им? RANSAC (Random Sample Concesus), вместване на геометрични примитиви...); регуляризация - "наказание" за сложността на модела (брой параметри); SVM, SVC (slack variables) - помощни променливи за съотношението между предела (margin) и грешката при класификация (по-малко обобщение, но по-малко грешки; повече обобщение, но повече грешки в класификацията). AdaBoost: съчетаване на "слаби ученици", малко по-добри от случайността, в обединен силен ученик ... двоичен класификатор; трудните примери: близки до границата на разделяне, премахване на най-трудните (срвн. GAN, 2014).

* **Angelova, A., Abu-Mostafa, Y., & Perona, P. (2005). Pruning training sets for learning of object categories.**
https://home.work.caltech.edu/pub/Angelova2005prune.pdf Автоматично изчистване на набор от данни от лоши примери за по-добро обучение; в

работата - за лица (шум, снимки които не са на лица, замъглени и пр.); общо - погрешни белези, маркиране (wrong labels, incorrect labels)

* **Real-time grasp detection using convolutional neural networks**, J. Redmon, A. Angelova, 2015 IEEE International Conference on Robotics and Automation (ICRA), 1316-1322, 1061 citations, 2015.

Cornell Grasping Dataset - labelled grasps. Ground truth grasps: g = {x, y, θ, h, w}; g - център на правоъгълника за хващане, θ - ориентация, ъгъл спрямо водоравната ос; w,h - ширина (дълбочина), височина (дължина). 5-измерен хващащ вектор вместо 7-измерен в друга работа (триизмерен), за да се сведе до разпознаване на образи; архитектура подобна на AlexNet, 3 конволюционни слоя и два напълно свързани, завършващи с 5 неврона отразяващи петте параметъра. Допускания за едно място за хващане - чист фон; при затрупан - първо сегментиране (cluttered scene); за parallel plate grippers (ръце с успоредни "щипки"); модел за много места за хващане: разделя на решетка NxN и научава вероятността във всяка клетка да има добро положение за захващане. ... Използва всеобща информация, а не плъзгащ се прозорец, в RGB-D пространство (стереокамера, образ и дълбочина)[3].

Video understanting: video object detection and activity recognition; CNN; Inflated Temporal Gaussian Mixture (iTGM); hybrid meta-architecture fill-in-the-blanks – the connectivity is fixed, but the modules can evolve.

Еволюционен алгоритъм: случайно се избира набор от възможни архитектури, изпробва се производителността им при разпознаване, най-добрата става „родител“, върху който се прилагат мутации, за да се получи „дете“, което се добавя към популация и се обучава за определен брой итерации, след което се оценява с друг набор за валидиране, което дава „приспособеността“ ѝ (fitness). От популацията, общ 25 архитектури, се премахва най-слабо приспособената и еволюционният цикъл се повтаря. Мутациите са 4 типа: 1) избор на времево-пространствен конволюционен слой и промяна на типа му. 2) Избор на времево-пространствен слой и промяна на времевия му размер (обхват). 3) Избор на модул от родителската архитектура и добавяне или премахване на паралелен поток между слоевете: между 1 и 6. Фиксиран брой изходни филтри, равномерно разпределени между паралелните линии. 4) Избор на модул и промяна на броя на повторенията му.

* **3D Open-Vocabulary Panoptic Segmentation with 2D-3D Vision-Language Distillation,** Xiao, Z., Jing, L., Wu, S., Zhu, A. Z., Ji, J., Jiang, C. M., Hung, W.-C., Funkhouser, T., Kuo, W., Angelova, A., Zhou, Y., & Sheng, S., 3.4.2024 (2025), 3.4.2024 https://arxiv.org/pdf/2401.02402 – Задача за безпилотни превозни средства, за да разграничат броими *обекти* наоколо (*things*) – други превозни средства, хора, препятствия – и неброими "*неща*" (*stuff*) - пътя, растителността край него, небето. Всеки отделен обект получава собствен етикет, докато "нещата" се възприемат като едно цяло, маса без собствена „единичност“ – подобно на категориите в естествения език ("насипни" и неброими са пясък, вода; могат да станат броими с мярка и уточнения: „чаша вода“, „лопата пясък“). В работата за пръв път едновременно разделят *нови* обекти и неща – „отворен речник“, несрещани в набора от данни за обучение – на отделните представители и семантична класификация (instance & semantic segmentation). Двуизмерното сегментиране на всичко с отворен речник е развито с употребата на CLIP (2D open-vocabulary); но за триизмерния случай не достигат достатъчно двойки данни за триизмерни облаци от точки и текст; виж *OpenScene*: per-pixel CLIP features → projecting 3D points onto image planes; RegionPLC: зрителни подкани върху области от изображението, контрастно обучение разделящо точки ...; в тази работа - само предварително обучен CLIP. ... Мултимодално сливане на особености ... В 2D: замразени особености на CLIP и 2D паноптично сегментиране, но в 3D не е пряко приложимо, защото много точки нямат валидни пиксели от камерата (скрити са зад други). P3Former. LiDAR-Vision ..

* **Драгомир Ангелов** – Stanford, Google, Waymo

Computer vision, ML, AI, self-driving cars …

Откъс от основния том:

Драгомир Ангелов - „Драго“ – ръководител в проекта за самоуправляваща се кола на „Гугъл“ (Waymo), с публикации от 1999 г.*, докторант по компютърно зрение в Станфорд. Компютърна геометрия, зрение, графика, моделиране на триизмерни обекти, анимация.

* **Anguelov, D., Learning Models of Shape From 3D Range Data**, 12.2005, PhD Thesis: https://ai.stanford.edu/~drago/Papers/thesis.pdf
* Дисертацията на Драгомир Ангелов, 2005 г.: извличане на геометричната информация за човешко тяло без учител; човешката фигура се разделя от триизмерни данни за координати, извлечени чрез лазерен скенер, като множество от части, свързани със стави, чрез автоматично разпознаване на частите с вероятностно минимизиране на изкривяванията и запазване на геодезическите разстояния и местната геометрия на мрежа от точки, описваща триизмерните данни (mesh). След това се подават конфигурации на обекта в различни положения (различни сканирания на един и същи човек или на различни хора), с променена поза, а системата я разделя на множество от твърди тела, разположението им, отношенията и конфигурацията (състоянията, положенията, завъртанията: виж бел. за роботика в приложението). Работата разглежда задачата за представяне на изкривяванията на повърхността на представянията на човешкото тяло като функция на ъглите на завъртане на ставите (виж „скинове“ в комп.графика) и др. Приложение за анимиране и предложено развитие за прихващане на движенията без маркери (motion capture).

По това време в Станфорд учи и работи и Васил Чаталбашев, който е водещ автор на проект за сегментирането на триизмерен модел на кампуса на университета чрез лазерен скенер. **Красимир Коларов** е може би първият българин в Станфорд, завършва роботика 1988-1992 г. а след това е и съавтор на лекциите и преподавател; запазена е негова лекция.

" за Изкуствен Интелект признаваме такава програма, която в произволен свят би се справила не по-зле от човек."

Тодор: Някои теми, разглеждани още в зората на „Свещеният сметач" и насока към общ ИИ. Не открих обаче да е споменат първия в света курс по УИР в Пловдив, нито друго съдържание от Т.А. Като цяло прочетеното ми се струва формално, без „фантазия" и „сетивно-моторно обосноваване", въпреки че за разлика от *Сметача* публикациите са в официален академичен формат. Необосновано нравоучение за етиката и „човечеството". Виж „Писма между 18-годишния Т.Арнаудов и философа…", 2002 и писмото ми до Оксфордския институт от 2012 г.

Todor: Some of the topics are related to the *Sacred Compute's* early works and overall **-** AGI. In my opinion superficial and unconvincingly moralizing though. No mentions of the pioneering AGI work from The Sacred computer and the 2010 AGI course and the definitions of T.A. starting as eary as 2001 and later in TUM 2001-2004.[4]

[4] However I didn't know D.Dobrev either up to today, 10.8.2025. I discovered him with a query to the freshly released GPT5.I may have tried out (or have encountered) *Strawberry Prolog* compiler maybe 20 years ago or about that time. D.D. was perhaps a principal developer. https://dobrev.com/

Влиятелни български „пророци“ от 1990-те до днес:

*** Пламен Ангелов –** БАН, Lancaster University, …
* **Никола Касабов –** ТУ София, Auckland и др.
* **Димитър Филев** – ТУ София, Auckland и др.

П.Ангелов и Н.Касабов имат съвместни работи по развиващи се разумни системи (evolving intelligent systems), системи с размита логика, мултимодалност; съчетания от размита логика и невронни модели и разпознаване с използване на прототипи[5]; обясним ИИ и др. Техен колега е и **Димитър Филев,** който има дълга кариера в автомобилната индустрия и награди за приноса си във внедряването на разнообразни системи с изкуствен интелект във „Форд“. Н.Касабов и лабораторията му сътрудничат с БАН по проекти в невронауките; мозъчно-компютърни интерфейси, извличане на информация за състоянието на мозъка от ЕЕГ и електроди и др. И тримата: връзката човек-машина, Human-Computer Interaction.

*** Dimitar P Filev – 65** h-index (Google Scholar, 19.7.2025) **Димиър Филев**

*** Explainable artificial intelligence: an analytical review,** PP Angelov, EA Soares, R Jiang, NI Arnold, PM Atkinson p.6. Fig 3. Opaque models (Ensemble, SVM, ANN, CNN, RNN …) vs Transparent (Decision trees, KNN, Rule-based, Bayesian, Linear regression) … Post-hoc explainability [by simplification, feature relevance, visual, local] → Explainable models… XAI taxonomy, … 4: Methods: feature, global, human-oriented, surrogate, concept, local and pixel-based … 5. Explainability-critical domains: medicine, criminal justice, tumor classifications, NLP, autonomous vehicles etc. 6.3. Future directions: **prototype-based models**; similarity instead of statistical … "**Interpretability**: is defined as the capacity to provide **interpretations** in terms that are **understandable** to a human (Gilpin et al., 2018)."* https://wires.onlinelibrary.wiley.com/doi/pdf/10.1002/widm.1424

Todor: This cited definition is circular and unexplicit: what is interpretation with simpler more explicit concepts; understandable by **who, which exact human/what are the capabilities**; by what kind of representation or language (how specific), with which tools and at what complexity and resolution. Complex explanations may include a lot of details anyway. Simple explanations are "understandable", but mundane such as textual as "a face has two eyes, a mouth…" (sometimes it doesn't; "too general") or e.g the "attention" masks – which areas of an image are most decisive for a classification decision, however these masks don't answer **WHY** they are more decisive, they are "deictic" – **pointing** at "this" and leaving the observer to interpret and understand. CPU machine code is exaplainable in its numerical format if you understand and recognize the instructions, can decode it in your mind or after disassembly with a proper debugger and tool, if you can trace the code, have appropriate debugger, patience, can reconstruct the program and its purpose etc.. ANN in their default form are also explainable in a similar way with enough patience, if you intervene inside their weights, test them with different inputs, retrain them etc. Therefore ***the degree of explainability*** is connected with the **amount of work, required for decoding**, in principle and of particular users, available auxilliary tools and skills etc. – their **complexity,** capacities/capabilities etc. should also be defined, like defining the observer-evaluator in broader contexts, discussed in the whole book of "*The Prophets of the Thinking Machines*" and in Theory of Universe and Mind.

https://www.researchgate.net/profile/Dimitar-Filev

През 2025 г. Димитър Филев е носител на наградата на IEEE *“Лютфи Задех”* за Димитър Филев за зараждащи се технологии: За техническо водачество и пионерен принос във възникващите умни технологии за управление и информационни системи в автомобилите.

https://corporate-awards.ieee.org/recipient/dimitar-filev/ 2025: IEEE LOTFI A. ZADEH AWARD FOR EMERGING TECHNOLOGIES “***For technical leadership and pioneering contributions to emerging automotive intelligent control and information systems.”***

[7] Costs: as of 16.7.2025, 4 active or 5 passive electrodes capture device is at 99 Euro, electrodes are 5/9 for passive/active. Too few electrodes. A complete 14-electrode wireless headset ~1000$.

***Димитър Филев** е пионер в системите интелигентно управление и ИИ в автомобилната индустрия. Основополагащатам у работа обединява невронни мрежи, размита логика, машинно обучение и напреднали технологии за управление, които създадоха революция в техниката за подпомагане на водачите и автономност на превозните средства. Като председател на отдела по Технологии за управление на „Форд“ и съвета за Технологии с изкуствен интелект, Филев беше в челния отряд на изследванията по интелигентни системи, водещи до развитието на съвсем нови функции и преживявания в автомобилната техника. Приносът му се простира о производството на автомобили, през системи за напътствия, предсказваща диагностика, автономно управление и др. Той беше движещата сила на въвеждането на методи с ИИ във „Форд“, водещи до въвеждането на огромен набор от функции с изкуствен интелект. Новаторските му изследвания продължават да разширяват пределите на ИИ в автомобилния сектор.*

Chordiogram: captures both the object boundary & the interior in a holistic way and is invariant to some rigid transformations & robust to deformations of the shape; it works even with clutter and unsegmented images**.** ***Chord features****:* length, orientation, normals. The normals point towards the interior of the object. **Quantization** of the chordiograms in bins. **Similarity**: **Intra-image** similarity, **Inter-image** similarity; **Co-saliency** score **function**; Co-saliency **region/feature Matching**; **segmentation** synchronization; image segmentation subspaces S1, S2 as eigenvectors; **co-salient region**; **Alignment** in the **embedding space**; Estimation of **Dense Correspondences**; **appearance** similarity between the regions; **geometric compatibility** with respect to the affine transformation; Finding the correct match for a point; ranking; several matches with high scores due to similar or repeating structure; **segment-based reranking**; compare quantitatively the difference between the initial and the improved set of feature matches. **Place Recognition task**; ***Related Work****:* **Spectral graph matching**, weighted graph matching: characterize the graphs by dominant eigenvectors: don’t capture co-salient structures; simultaneous object recognition and segmentation with spectral clustering in a graph, capturing the relationship(pixels, object parts); correct partial correspondences between manifolds: infer the complete alignment by regularization based on similarities between points on the manifolds**. Spectral graph matching**, **spectral clustering**; Co-segmentation: simultaneous segmentation of two images and extraction of the common

objects: generative graphical model: a smoothness prior for segmentation and **appearance-based model** for the common object; usually described as **histogram**. **Joint image representation**: the similarity between images as the composability of one of the images from large segments of the other image. ... **Co-salient regions:** segments which are **coherent and distinct from their surroundings & similar to each other**; feature similarities. **Normalized Cuts** framework. Bins. **Partitioning** of the **bins**. **Boundary grouping** principles; edge/contour detector cannot detect all object boundaries since there is no evidence in the image, but **the boundaries can be hallucinated to recover the missing ones**. Perceptual **Grouping** & Region grouping **principles**, perceptually salient segmentation; **unnatural**: **Intersecting contours** & **Including** contour. **Segments**: A **set** of **regions**. **Boundaries**: A set of non-intersecting, non-including, closed contours (see Fig. 3.5). Region-boundary constraints. Shape-based **detection cost.** Segmentation: The opimal values of the boundary and segment indicators; **object interior and boundary**. **Shape-based detection cost**: The minimum of the objective function quantifies the quality of match based on shape similarity. **Region-boundary constraints**; contours as a result of **bottom-up contour grouping** preprocessing step. The use of **pre-grouped contours** leads to more stable solution and reduces the computational complexity: but ignoring region information; bottom-up grouping by selecting object boundaries from a set of long salient contours [Zhu et al., 2007]; segments as additional constraints. **Shape Matching;** Parametrization of the chordiogram, boundary indicators, **L1 distance; shape matching cost**; shape similarity between a model and a particular selection of segment boundaries: minimization of the cost while taking into account the relation between boundaries and segments. *Decompose a chordiogram in terms of chordiograms which relate pair of boundaries*; select via boundary indicator variables; sum of all boundary-pair chordiograms for all pairs of boundaries; **boundary indicator variables**; Chordiogram **additivity**; Segment boundary parameterization; Segment parametrization; segment: **foreground** or **background (1,-1);** preprocessing: **Oversegmentation**. **Boundary Structure Segmentation (BoSS):** detection and segmentation simultaneously in a unified framework; shape similarity and figure/ground segmentation in a single step. Linear constraints relating **superpixels** with their boundary. [**multilevel**] bin-based distance, graph matching and chordiogram distance; correspondence on pairs of shapes & correspondence recovery**. Familiarity with the target shape** plays a large role in **figure/ground** assignment. Perceptually salient region; chordiogram matching as **bipartite matching among chords**. **Shape Part Correspondence**: quantify the similarity between two shapes by establishing correspondences between points on the shapes which serves as an explanation. **Shape representation**: object **boundary (closed curve)** & **interior**. 2.1. **Contour-based shape descriptors**: s**hape context, k-adjacent segments, hierarchical shapes; shock graphs.** Interior: in **ambiguous** cases it must be **selected** (e.g. Rubin's vase). Holism, holistic approach: **Gestaltism**, **emergent properties** of art configurations. **Edge**- and **texture**-based local descriptors: a **patch** in the image can contain **rich information**; **unlike shape**: very limited expressiveness – locally a curve, potentially with a few high curvature points. .. **Transformation invariance**: **rigid** & **non-rigid; Articulations**: composition of independent deformable parts; Image **artifacts**, **Clutter**, **Occlusion** & **missing parts**. … See the references.

* **From Multimodal LLMs to Generalist Embodied Agents: Methods and Lessons,** Andrew Szot, Bogdan Mazoure, Omar Attia, Aleksei Timofeev, Harsh Agrawal, Devon Hjelm, Zhe Gan, Zsolt Kira, Alexander Toshev, 11.12.2024 https://arxiv.org/abs/2412.08442 – MLLMs, extending the tasks to Embodied AI, Games, UI Control, Planning. Generalist Embodied Agent (GEA); supervised learning on large multimodal data, the importance of cross-domain data – strong generalization across unseen tasks; a unified learned multi-embodiment action tokenizer; physics and geometric reasoning. Vision-Language-Action models; strong generalist capabilities; multi-embodiment action tokenizer vs uniform discretization of OpenVLA; cmp: multi-task agents; finetuning LLMs with self-generated data‘ goal-specified PartiallyObservable Markov Decision Processes (POMDPs) ; Spaces: observation, action, goal; reward model: O,A,G,R.The goal space G – textual description of the task to solve. O – RGB images; environment types – *domains* with a diverse set of action spaces. The goal is to learn one policy which works in many environments E. $M_i = (O_i, A_i, G_i, R_i)$ for each i ∈ E. * **Generic Image Library** - GIL, then in Boost C++

Facebook Image Classification 2012 - Lubomir was the first guy hired to do computer vision; "run on 300M photos per day". First year - traditional CV features; then: CNN, 9 versions for 2 years, the latest recognizes "more than a thousand types of objects, scenes, activities and places of interest using convolutional neural networks with multiple loss functions." Peak load:10K calls/sec, run on every photo & every second of every video on Facebook and

Instagram. Lubomir developed "a large part of the training code as well as a highly optimized feedforward path used in production."

*** Deep Poselets for Human Detection,** Lubomir Bourdev, Fei Yang, Rob Fergus**,** Computer Vision Arxiv 2014 *.. detecting people in natural scenes using a part approach based on poselets.. a bootstrapping method that allows to collect millions of weakly labeled examples for each poselet type; train a CNN to discriminate different poselet types and separate them from the background class.* Then: the CNN → *represent poselet patches with a Pose Discriminative Feature (PDF) vector -- a compact 256-dimensional feature vector that is effective at discriminating pose from appearance.* The poselet model is trained *on top of PDF features and combine them with object-level CNNs for detection and bounding box prediction. The resulting model leads to state-of-the-art performance for human detection on the PASCAL datasets.*

* **Articulated Pose Estimation using Discriminative Armlet Classifiers**, Georgia Gkioxari, Pablo Arbelaez, Lubomir Bourdev and Jitendra Malik, Computer Vision IEEE Conference in Computer Vision and Pattern Recognition (CVPR 2013) ... *a novel approach for human pose estimation in real-world cluttered scenes; focus on the challenging problem of predicting the pose of both arms for each person in the image. .. the notion of poselets, training a highly discriminative classifiers to differentiate among arm configurations – armlets; a rich representation which, in*

addition to standard HOG features, integrates the information of strong contours, skin color and contextual cues in a principled manner. Unlike existing methods: an evaluation on a large subset of images from the PASCAL VOC detection dataset with critical visual phenomena, such as occlusion, truncation, multiple instances and clutter are the norm. Their approach outperforms Yang and Ramanan, the state-of-the-art technique, with an improvement from 29.0% to 37.5% PCP accuracy on the arm keypoint prediction task, on this new pose estimation dataset.

*** Semantic Contours from Inverse Detectors,** Bharath Hariharan, Pablo Arbelaez, Lubomir Bourdev, Subhransu Maji and Jitendra Malik**,** Computer Vision International Conference in Computer Vision (ICCV 2011)

We study the challenging problem of localizing and classifying category-specific object contours in real world images. For this purpose, we present a simple yet effective method for combining generic object detectors with bottomup contours to identify object contours. We also provide a principled way of combining information from different part detectors and across categories. In order to study the problem and evaluate quantitatively our approach, we present a dataset of semantic exterior boundaries on more than 20, 000 object instances belonging to 20 categories, using the images from the VOC2011 PASCAL challenge

* **Poselets: Body Part Detectors Trained Using 3D Human Pose Annotations,** Lubomir Bourdev and Jitendra Malik**,** Computer Vision International Conference in Computer Vision (ICCV 2009)

* **Generic Image Library,** Lubomir Bourdev**,** Software Engineering Software Developer's Journal 2007 **–** *The Generic Image Library (GIL) is a C++ image library sponsored by Adobe Systems, Inc. and developed by Lubomir Bourdev and Hailin Jin. It is an open-source library, planned for inclusion in Boost 1.35.0. GIL is also a*

part of the Adobe Source Libraries. It is used in several Adobe projects, including some new features in Photoshop CS4

* **Robust Object Detection Via Soft Cascade,** Lubomir Bourdev and Jonathan Brandt**,** Computer Vision IEEE Conference in Computer Vision and Pattern Recognition (CVPR 2005) *A method for training object detectors using a generalization of the cascade architecture, which results in a detection rate and speed comparable to that of the best published detectors while allowing for easier training and a detector with fewer features. In addition, the method allows for quickly calibrating the detector for a target detection rate, false positive rate or speed. One important advantage of our method is that it enables systematic exploration of the ROC Surface, which characterizes the trade-off between accuracy and speed for a given classifier.*

* **Art-Based Rendering of Fur, Grass, and Trees,** Michael Kowalski, Lee Markosian, J.D. Northrup, Lubomir Bourdev, Ronen Barzel, Loring Holden and John Hughes**,** Computer Graphics ACM Transactions on Graphics (SIGGRAPH 1999) *Artists and illustrators can evoke the complexity of fur or vegetation with relatively few well-placed strokes. We present an algorithm that uses strokes to render 3D computer graphics scenes in a stylized manner suggesting the complexity of the scene without representing it explicitly. The basic algorithm is customizable to produce a range of effects including fur, grass and trees, as we demonstrate in this paper and accompanying video. The algorithm is implemented within a broader framework that supports procedural stroke-based textures on polyhedral models. It renders moderately complex scenes at multiple frames per second on current graphics workstations, and provides some interframe coherence.*

* **Rendering Nonphotorealistic Strokes with Temporal and Arc-Length Coherence,** Lubomir Bourdev**,** Computer Graphics Master's Thesis, Brown University, 1998 **–** *Rendering a silhouette of an object in a frame-to-frame coherent way. The input to the system each frame is a set of silhouette pixels in a rendering of the object and their corresponding silhouette edges in a polygonal model (mesh) of the object. The output is a set of silhouette strokes.*

* **Real-Time Nonphotorealistic Rendering,** Lee Markosian, Michael Kowalski, Sam Trychin, Lubomir Bourdev, Daniel Goldstein and John Hughes**,** Computer Graphics ACM Transactions on Graphics (SIGGRAPH 1997) *Nonphotorealistic rendering (NPR) can help make comprehensible but simple pictures of complicated objects by employing an economy of line. But current nonphotorealistic rendering is primarily a batch process. This paper presents a real-time nonphotorealistic renderer that deliberately trades accuracy and detail for speed. Our renderer uses a method for determining visible lines and surfaces which is a modification of Appel's hidden-line algorithm, with improvements which are based on the topology of singular maps of a surface into the plane. The method we describe for determining visibility has the*

potential to be used in any NPR system that requires a description of visible lines or surfaces in the scene. The major contribution of this paper is thus to describe a tool which can significantly improve the performance of these systems. We demonstrate the system with several nonphotorealistic rendering styles, all of which operate on complex models at interactive frame rates.

#Vision Tasks #Vision-Language Tasks #Зрителни задачи

Vision Tasks: Image Classification, Object Detection, Semantic Segmentation, Instance Segmentation, Panoptic Segmentation, Image Captioning, Image Generation, Object Tracking, Pose Estimation, Action Recognition, Face Recognition, Keypoint Detection, Optical Character Recognition (OCR), Depth Estimation, 3D Object Reconstruction, Super-Resolution, Image Inpainting, Image Denoising, Image Style Transfer, Image Colorization, Image Superpixel Segmentation, Visual Question Answering (VQA), Scene Understanding, Image-to-Image Translation, Visual Saliency Prediction, Texture Synthesis, Image-to-Text Generation, Visual Grounding, Landmark Detection, Scene Text Detection, Visual Semantic Parsing, Object Localization, Visual Odometry, Human-Object Interaction Recognition, Human Pose Estimation, Eye Gaze Detection, Visual Turing Test, Visual SLAM, Anomaly Detection in Images, Clothing Recognition, Food Recognition, Artistic Style Classification, Gesture Recognition, Animal Species Classification, Handwriting Recognition, Light Field Imaging, Image Compression, Data Augmentation for Vision Tasks, Disaster Image Assessment, Video Summarization, Video Captioning, Video Action Detection, Dynamic Scene Segmentation, Motion Tracking, Video Object Segmentation, Cross-Domain Image Classification, Video Colorization, Motion Estimation, Person Re-identification, Vehicle Detection and Tracking, Medical Image Segmentation, Medical Image Classification, 3D Pose Estimation, Change Detection in Satellite Images

Vision-Language Tasks: Visual Question Answering (VQA), Image Captioning, Text-to-Image Generation, Image-Text Matching, Cross-modal Retrieval, Visual Commonsense Reasoning, Visual Entailment, Image-Text Alignment, Text-Image Synthesis, Visual Reasoning, Multimodal Sentiment Analysis, Text-based Object Detection, Image-based Text Generation, Multimodal Machine Translation, Scene Graph Generation, Visual Dialogue, Zero-Shot Visual Classification, Cross-modal Retrieval from Visuals, Visual Question Answering with Explanation, Multimodal Summarization, Speech to Image Generation, Image Captioning with Localization, Image Retrieval with Natural Language Queries, Textual Entailment with Visual Context, Multimodal Sentiment Classification, Image Description Generation from Text Queries, Visual Concept Recognition, Visual Storytelling, Visual

Grounding in Text, Multimodal Event Detection, Image-Text Cross-Modal Reasoning, Interpretable Visual Question Answering, Fine-Grained Visual-Textual Matching, Image Captioning with Object Detection, Emotion Recognition from Text and Images, Scene Understanding with Textual Input

Термини и юнашко наречие: визуален – зрителен, образен; генериране – пораждане; сегментиране – разделяне, реконструиране – възстановяване; 3D – триизмерно; локализация – уместяване; модалност – сетивност, вид данни; мултимодален – многосетивен; всички модалности, вкл. двигателни: всетводействие, всетводействен; текст – слово; контекст - обслов

Зрителни задачи с образи и видео: Класификация на изображения, Откриване на обекти, Семантично сегментиране, Сегментиране на инстанции, Паноптично сегментиране, Пораждане на надписи за изображения, Пораждане на изображения, Проследяване на обекти, Оценка на позата, Разпознаване на действия, Разпознаване на лица, Откриване на ключови точки, Оптично разпознаване на символи (OCR), Оценка на дълбочина, 3D-възстановяване на обекти, Супер-резолюция, Възстановяване на изображения, Шумопочистване на изображения, Пренос на стил в изображения, Оцветяване на изображения, Сегментиране на суперпиксели на изображения, Визуален отговор на въпроси (VQA), Разбиране на сцени, Превод от изображение в изображение, Прогнозиране на зрителна важност, Синтез на текстури, Пораждане на текст от изображения, Зрително търсене на предмети, Откриване на забележителности, Откриване на текст в сцена, Зрителен семантичен разбор , Локализация на обекти (Уместяване на предмети), Зрителна одометрия, Разпознаване на взаимодействие между хора и предмети, Оценка на позата на човек (оценка на положението), Откриване на посоката на погледа, Зрителен тест на Тюринг, Зрителен SLAM (зрително едновременно уместяване и рисуване на карта), Откриване на необичайност в изображения, Разпознаване на дрехи, Разпознаване на храни, Класификация на художествени стилове, Разпознаване на жестове, Класификация на животински видове, Разпознаване на ръкописен текст, Снимки на светлинни полета, Снимане на изображения, Разширяване на данни за задачи с изображения, Оценка на изображения при бедствия, Резюмираност на видео, Генериране на надписи за видео (пораждане на надписи за видео), Откриване на действия във видео, Сегментиране на динамични сцени, Проследяване на движение, Сегментиране на обекти във видео, Прехвърляне на цвят на видео, Оценка на движение, Смяна на лица, Откриване и проследяване на превозни средства, Сегментиране на медицински изображения (разделяне на медицински изображения), Класификация на медицински изображения, Триизмерна оценка на позата, Откриване на промени в сателитни изображения.

Зрителни задачи с образи и текст, слово: Зрителен отговор на въпроси (VQA), Генериране на надписи за изображения, Пораждане на изображения от текст, Съответствие между изображения и текст, Прехвърляне между модалности (пренос, многосетивен пренос), Разбиране на общи образни смисли, Зрително заключение, Приравняване на съдържанието между изображения и текст, Пораждане на текст от изображения, Зрително разсъждение, Мултимодален анализ на емоции, Откриване на обекти чрез текст, Генериране на текст от изображения, Мултимодален машинен превод, Пораждане на графи на сцени (отношения между части, вложеност и др.), Зрителен диалог, Зрителна класификация без примери и подготовка (Zero-shot), Междусетивен пренос от изображения, Зрителен въпрос отговор с обяснение, Многосетивно обобщение, Пораждане на изображения от текстови въпроси, Извличане на изображения с текстови запитвания (словесни запитвания), Словесен извод в обслов на изображения, Мултимодално класифициране на емоции (многопредметно определяне на чувства), Генериране на описание на изображения от текстови запитвания, Разпознаване на образни понятия, Образно разказване на истории, Образно обосноваване в текст, Мултимодално откриване на събития, Кръстосано-разбиране на изображения и текст, Отговаряне на въпроси с тълкуване, Точно съвпадение между слово и изображения, Пораждане на надписи за изображения с уместяване на предмети, Разпознаване на изразени чувства от текст и изображения, Разбиране на сцени с текстов вход. …

* Тодор Арнаудов (Todor Arnaudov)

***„Smarty - Extendable Framework for Bilingual and Multilingual Comprehension Assistants**”, Todor Arnaudov, Ruslan Mitkov, LREC 2008 – „най-интелигентният речник в света“, подпомагащ превода с голям брой обработки на естествен език и използващ контекста за разрешаване на многозначност. Използва WordNet, BalkaNet и обикновен речник и мощен графичен интерфейс, при който може да се посочва всяка дума. Разработен до завършен прототип с всички функции за около три месеца от нулата от Т.Арнаудов, научен ръководител Р.Митков.

Интерфейсът на „Смарти“ започна да навлиза в уеб сайтове за превод като „Reverso Context” и др. десетина или 15 години по-късно. Около 2012-2013 г. се разработваше версия на Java с допълнителни възможности за пораждане на код по образец и по-развит интерфейс, която не беше публикувна. Продължение на „Смарти“ е „Research Assistant, още „Assistant C#” или само „Assistant”, замислен още през 2007 г. – виж насоките за изследвания и разработка от *„Първата модерна стратегия за развитие чрез изкуствен интелект* …“ През март 2024 г. за кратко се разработиха подобрения на „Смарти“ в „Smarty 2”, но засега не са публикувани.
http://www.lrec-conf.org/proceedings/lrec2008/pdf/826_paper.pdf
https://aclanthology.org/L08-1586/
https://github.com/Twenkid/Smarty

„Смарти“ имаше голям потенциал, някои от причините да не се доразвие в края на 2000-те бяха организационни и лични. Друго беше опасение, че не може да се състезава с „Гугъл“ и тяхната развиваща се услуга за машинен превод – това беше погрешно. От 5.2024 г. в *Research Assistant,* универсалният помощник, наследник на „Смарти“, се използва безплатна услуга за машинен превод на „Гугъл“.

* **GPT2-MEDIUM-BG, T.Arnaudov 2021** – един от най-големите езикови модели за езици, различни от английския, до 2021 г Разработих и метод за пораждане с неограничена дължина и промяна на темата, чрез постепенно вмъкване на скрити подкани, които не се включват в изведеният текст. Виж таблицата в края на този том. LLM. https://huggingface.co/twenkid/gpt2-medium-bg

* **Superhuman** (~2012-2013, Java) – unpublished, **Smarty 2** (2024 – announced, unpublished), **Research Assistant** (Assistant C#, ACS, Assistant) – conceived since 2007, in-house use since early 2010 – unpublished (as of 17.8.2025) – виж бъдещи публикации.

* **Why build another part-of-speech tagger? A minimalist approach.** Leonid Peshkin, Virginia Savova https://www.researchgate.net/profile/Leonid-Peshkin/publication/228789616_Why_Build_Another_Part-of-Speech_Tagger_A_Minimalist_Approach/ (See *Bayesian nets in syntactic categorization of novel words* above) – *The dilemma: statistically extracted or expert-selected features?* The most likely tags: 90% correct; dictionaries; the best-known rule-based tagger [Brill'94]: 1. assign the most likely tag to each word in the text; 2. apply transformation rules of the form "Replace tag X by tag Y in triggering environment Z", where the trig.env. spans up to 3 sequential tokens in both directions and refers to words, tags or properties of words within the region. The Brill tagger: < 3.5% error on the Wall Street Journal (WSJ) corpus. However rule-based taggers perform poorly on different datasets, e.g. Netlingo (e-mail, newsgroups, web sites). *"The typical inference task is to determine the probability distribution over the states of a hidden variable over time, given time series data of the observed variables. This is usually accomplished using the forward-backward algorithm. Alternatively, we might obtain the most likely sequence of hidden variables using the Viterbi algorithm. These two kinds of inference yield resulting PoS tags. Note that there is no need to use "beam search", (cf. [Brants'00])."* Tests of the performance after omitting some of the *binary features* (see the other paper). Morphology helps for better results. OoV words (out of vocabulary). GAWK[11] scripts for text processing.

Разрешаването на многозначност в Smarty

"Най-интелигентният речник" от 2007 г. „Smarty", T.Arnaudov, R.Mitkov също извършваше WSD, но по прост начин с „торба от думи" (bag of words) и размито сравнение с нормализация по статиите с примери от WordNet (използван 2.0 по технически причини). Следващата стъпка беше да се търси в свързани с тях думи и пр., но не беше изпълнена.

2. Robustness and Sound Approximations – point $x:R^K$; a ball of radius epsilon around a point assigns the same class to all points. π-robust … labeled training examples … worst-case adversarial loss; abstract interpretation (Cousot & Cousot, 1977): abstract domain D, abstraction function α; concretization function γ; $P(R^d) \rightarrow D(R^p)$, p ∈ N; abstract transformer (computable function); overapproximates; interval domain; zonotope, total error … line segments as Hybrid zonotopes ...

* Cousot, P. and Cousot, R**. Abstract interpretation: a unified lattice model for static analysis of programs by construction or approximation of fixpoints**. In Symposium on Principles of Programming Languages (POPL), 1977. https://www.di.ens.fr/~cousot/COUSOTpapers/publications.www/CousotCousot-POPL-77-ACM-p238--252-1977.pdf
-34*456 -(+)*(+) (-)*(+) (-) … the results of the abstract execution give some info on the actual computations; consistent abstract interpretations form a lattice … abstract program properties – complete semilattice; order-preserving functions…

Topic: Static program analysis of programs (without execution); simplification; loss of precision; soundness: must be correct in the concrete execution; concrete domain; abstraction function alpha and concertization f. gamma. Program semantics as fixpoints (stable states, points of equations) - widening: jumping to more general abstract state vs, narrowing: get a more precise form from an over-approximated fixpoint. **Static analysis:** type checking, data flow analysis, security, bug detection, verification(prove specification properties, check safety conditions, find optimization opportunities). Abstract domains: represent selected program properties - simpler than the concrete program states, but they must preserve the relevant inf. for analysis. Usages: dead code elimination, constant propagation, loop optimization, proving lack of runtime errors, checking security properties, verifying concurrent programs; null pointer detection, array bounds checking, memory leak detection
TA: Note that AST, Abstract Syntax Trees are slightly different domain about the syntax, syntactic structure, formal grammars for parsing and compilation, originating in 1960s; while the Cousot's Abstract interpretation is about the semantics as integrity and safety, verification, program analysis.

…

confidence and decide is the prediction above particular certainty. The adversarial training: applying valid modifications of the program $\delta \subseteq \Delta(x)$, e.g. changing identifiers ("width" to "h", "height" to "w") and evaluating the predictions which by default may become wrong – if the model is biased with specific identifiers, e.g. "width" is usually abbreviated to "w" and "h" may confuse it. The adversarial training aim is not to minimize the expected loss on the original distribution E(x,y)~D[loss((f, gh)(x), y)], but the expected adversarial loss: max ... (x + δ), y)]

average performance, closeness of functions,

The theorem about the NN as universal approximators even with just a single hidden layer, given the mentioned above conditions about the activation function etc., given a sufficient amount of hidden units are available (see “requisite variety”).

*** INSAIT** – Institute for Computer Science, Artificial Intelligence and Technology
* **ИНСАЙТ** – Институт по компютърни науки, изкуствен интелект и технологии

* https://insait.ai/ * https://insait.ai/publications/

Българо-швейцарският международен институт „ИНСАЙТ“ по заявени цели, предмет на дейност, стратегия и др. е едно от **многобройните производни и повторения на *оригиналната българска стратегия*** за изследвания и разработка на универсални мислещи машини, общ изкуствен интелект, публикувана от 18-годишния Тодор Арнаудов **в средата на 2003 г**. на конкурс с тема: *„Как бих инвестирал един милион с най-голяма полза за развитието на страната?*[17]*“*, като понякога изказванията на представителите на института или в медиите, отразяващи разширенията на дейността на „ИНСАЙТ“ в нови области, над 20 години по-късно, повтарят *буквално* и дословно оригиналната стратегия от 2003 г. Има разлики в начина на осъществяването, „елитаризма“ и международността, огромните финансови изисквания и стотици милиони лв начални държавни грантове и др.

[17] Виж също проекта на Ахмед Мерчев „Кибертрон“, обявен около 2002-2003 г.

Случаят е разгледан в приложението-книга ***„Първата модерна стратегия за развитие чрез изкуствен интелект е публикувана от 18-годишен българин и повторена и изпълнена от целия свят 15-20 години по-късно: Българските пророчества: Как бих инвестирал един милион с най-голяма полза за развитието на страната“***, Т.Арнаудов, 2025 г. и в специализираното приложение ***„Институти и стратегии за изкуствен интелект „на световно ниво“ в Източна Европа и света“***, където е направен по-широк и подробен преглед и сравнение на съдържанието и дейността на голям брой национални стратегии за разработка и развитие на и чрез ИИ. #instituti (ще бъде публикувано на конференцията SIGI-2025)

* От **„Първата стратегия…“**, Литература и бележки към нея, относно неверни или неточни твърдения на института във връзка с BgGPT, т.нар. *„първи отворен голям езиков модел за български език“* и др.

236. Ранни пораждащи големи езикови модели от типа GPT за езици, различни от английския: български, френски, арабски, испански, португалски, немски, китайски; гръцки, сръбски, румънски, японски – 2020-2021 г. Датата на някои – по дати на файловете с теглата на модела, дата на научна статия и пр. Само френският, арабският, румънският, японският и *българският* са с над 100-тина милиона параметъра. *Румънският* е силен, обучаван на 17 GB-ов корпус. *Само българският* вероятно е разработен от един-единствен човек с бюджет и подкрепа = 0 и авторът представя родната компютърна лингвистика в тази дисциплина като *самозван „хайдутин“,* понеже институциите и по-„елитните“ бойци чакаха до 2023-2024 г. [66] (няма данни [за по-ранни подобни модели]). Сравни с аналогичен случай с ДЗБЕ около 2001-2003 г. и бездействието на ИБЕ на БАН и на останалите филолози от университетите спрямо явленията, срещу които ДЗБЕ се противопоставяше и се опитваше да „призове“ „чети“ [16][40], а *„мастититe“ езиковеди* (по определението на Павлин Стойчев, „PC World Bulgaria“, 5.2003 [239]) гледаха безучастно и обясняваха, че това били *„естествени процеси“.* Сравни с бележките за *„Добродетелната дружина и нехранимайковците“* и [40], 2003 г., дали талантите не са имали избор да не учат в „най-престижните университети“ и да развият местните и пр. XLM-R от „Фейсбук“, 11.2019 е по-голям, но в него българският е един от 100 езика, на които е обучаван, и е за класификация и отговаряне на въпроси, а не за пораждане.

Бележка от страницата на българския модел:
*** Note from GPT2-Medium-BG page on Huggingface:**
* **Other Bulgarian autoregressive models:** an earlier one was a few seconds display of a generation in Bulgarian by a startup called BAIHUI AI in mid 2019. I've written in my blog 1.5B, but I don't remember if they have mentioned a size and now it seems unlikely and unreasonable, they just showed that they can train a model, a team of 3 people, only one of them a ML engineer. There are a few surviving records: my blog post: https://artificial-mind.blogspot.com/2019/07/baihuiai-baihuiai-new-bulgarian-ai.html and info here: https://www.eu-startups.com/directory/baihui-ai/ The company didn't live long. Now it seems reasonable that their model was GPT2-SMALL, as that was the usual choice even 4 years later and even the Bulgarian Academy of Science 2023 model was the small one. I found several other GPT2-SMALL models trained later than this one here, one for poetry, the BAS' from 2023 and maybe a few others. I couldn't get info from the ML engineer of the BAIHUI project ***Mitko Vassilev****:* https://mitkox.com/#home
